

**VA FILEMAN
ADVANCED USER MANUAL**

Version 22.0

March 1999

Department of Veterans Affairs
VISTA Software Development
Infrastructure Product Line

Preface

The *VA FileMan Advanced User Manual* is designed to provide you, the **VISTA** user, with "how to" information on the functions of VA FileMan, **VISTA**'s database management system.

This manual shows how to use features of VA FileMan that are likely to be used by ADPACs (ADP Application Coordinators), IRM staff, and other technical users.

The following major features of VA FileMan are introduced along with a description on how to use them:

- Advanced editing techniques.
- Importing and exporting data.
- Computed expressions and VA FileMan functions.
- Defining files and fields.
- Data security.
- Archiving data.
- System Management for VA FileMan.

The *VA FileMan User Manual* is comprised of two separate HTML (Hypertext Markup Language) documents:

- The *VA FileMan Advanced User Manual* (this manual) describes features that are more likely to be used by ADPACs (ADP Application Coordinators), IRM staff, and other technical users.

Also available in Hypertext Markup Language (HTML) format.

- The *VA FileMan Getting Started Manual* shows how to use VA FileMan features that are likely to be used by *all VISTA* users.

Available in both Adobe Acrobat Portable Document Format (PDF) and Hypertext Markup Language (HTML) format.

Manuals in HTML

Why produce an HTML (Hypertext Markup Language) edition of the VA FileMan User Manual?

- The HTML versions of the VA FileMan manuals are useful as online documentation support as you use VA FileMan. HTML manuals allow you to instantly jump (link) to specific topics or references online.
- The VA FileMan HTML manuals are "living" documents that are continuously updated with the most current VA FileMan information (unlike paper or printed documentation). They are updated based on new versions, patches, or enhancements to VA FileMan.
- Presenting manuals in an HTML format on a web server also gives new opportunities, such as accessing embedded multimedia training material (e.g., movies) directly in the manuals themselves.
- Providing manuals in a native online format (HTML) also helps introduce HTML and web servers to the **VISTA** user community as documentation platforms for VHA.
- As more user workstations become network-capable, access to information in these HTML manuals is increased by making them available over the VA network.

Feedback

The VA FileMan Development Team encourages you to send to them questions and comments about the completeness and accuracy of this manual and suggestions for its improvement. Send us feedback at:

G.FMTEAM@FORUM.VA.GOV

Table of Contents

Orientation

Installation of VA FileMan in the Veterans Health Information Systems and Technology Architecture (**VISTA**) environment is described in the *VA FileMan Installation Guide*.

How to Use this Manual

This manual uses several methods to highlight different aspects of the material:

- Descriptive text is presented in a proportional font (as this is).
- "Snapshots" of computer online displays (i.e., roll-and-scroll screen captures/dialogues) and computer source code are shown in a *non*-proportional font and enclosed within a box.
 - User's responses to online prompts will be in boldface type.
 - The "<**RET**>" found within these snapshots indicate that the user should press the Enter or Return key on their keyboard.
 - Author's comments are displayed in italics or as "callout" boxes (callout boxes refer to labels or descriptions, usually enclosed within a box, which point to specific areas of a displayed image).
- All uppercase is reserved for the representation of M code, variable names, or the formal name of options, field and file names, and security keys (e.g., the XUPROGMODE key).

- Three symbols are used throughout the documentation to alert the reader to special information. The following table gives a description of each of these symbols:

Symbol	Description
	Used to inform the reader of general information including references to additional reading material.
	Used to caution the reader to take special notice of critical information.
	Used to inform the reader of helpful tips or tricks they can use when working with VA FileMan.

Table 1: Documentation Symbol Descriptions

Assumptions About the Reader

This manual is written with the assumption that the reader is familiar with the **VISTA** computing environment.

No attempt is made to explain how the overall **VISTA** programming system is integrated and maintained. Such methods and procedures are documented elsewhere. We suggest you look at the various VA home pages on the World Wide Web (WWW) for a general orientation to **VISTA**. For example, check out the following web sites:

- Veterans Health Information Systems and Technology Architecture (**VISTA**), formerly known as the Decentralized Hospital Computer Program (DHCP) System:
 - <http://www.va.gov/vama.htm#DHCP> OR
 - <http://vawww.va.gov/vama.htm#DHCP>
- **VISTA** Software Development Home Page: <http://www.vista.med.va.gov/>

Related Manuals and Other References

Readers who wish to learn more about VA FileMan should consult the following:

- *VA FileMan V. 22.0 Release Notes* (PDF format)
- *VA FileMan V. 22.0 Installation Guide* (PDF format)
- *VA FileMan V. 22.0 Technical Manual* (PDF format)
- *VA FileMan V. 22.0 Advanced User Manual* (HTML format)
<http://www.vista.med.va.gov/softserv/infrastr.uct/fileman/u2/index.html>
- *VA FileMan V. 22.0 Programmer Manual* (HTML format)
<http://www.vista.med.va.gov/softserv/infrastr.uct/fileman/pm/index.html>

Readers who wish to learn more about VA FileMan should consult the VA FileMan Home Page at the following web address:

<http://www.vista.med.va.gov/softserv/infrastr.uct/fileman/index.html>

This site contains additional information and documentation.

VA FileMan documentation is made available online (**HTML** format), on paper, and in Adobe Acrobat Portable Document Format (**.PDF**).

The **HTML** documents must be read using a web browser (e.g., Microsoft Explorer or Netscape Navigator, both of which are freely distributed). Using the web browser, open the "table of contents" page (i.e., INDEX.HTML). The distinguishing characteristic of manuals in this format are the *hypertext jumps* contained within the text. Clicking on a hypertext jump causes your browser to jump to the location or document described in the jump. The *VA FileMan Getting Started Manual*, the *VA FileMan Advanced User Manual*, and the *VA FileMan Programmer Manual* are all linked together.

The **.PDF** documents must be read using the Adobe Acrobat Reader (i.e., ACROREAD.EXE), which is also freely distributed by Adobe Systems Incorporated at the following web address:

<http://www.adobe.com/>

Orientation

For more information on the use of the Adobe Acrobat Reader, please refer to the "Adobe Acrobat Quick Guide" at the following web address:

<http://www.vista.med.va.gov/softserv/infrastr.uct/acrobat/index.html>

Introduction

What is VA FileMan?

VA FileMan creates and maintains a database management system that includes features such as:

- A report writer
- A data dictionary manager
- Scrolling and screen-oriented data entry
- Text editors
- Programming utilities
- Tools for sending data to other systems
- File archiving

Introduction

Part I: Tools

1. Import and Export Tools

If you want to use an application like Microsoft Excel to manipulate data stored in a VA FileMan file, you need some way to exchange that data between VA FileMan and your application. VA FileMan provides the Import and Export Tools for this purpose.

Suppose, for example, that you want to use Microsoft Word's Print Merge utility to print a form letter to a list of recipients that is maintained in a VA FileMan file. You can use VA FileMan's **Export Tool** to export the list of recipients from the VA FileMan file to Microsoft Word. Once you've done this, you can use Word to generate your form letters based on the exported list.

What Applications Can You Exchange Data With?

In theory, you can exchange data with any application that supports delimited or fixed-length ASCII data exchange. Many applications do, using a variety of formats. Typically, you can expect the ability to import and export data with the following types of applications:

- Databases
- Spreadsheets
- Statistical and Analysis Programs (SAS, SPSS, etc.)
- Vertical Applications
- Word Processor (data records, *not* word processing text)

You can export data records to a word processor, which often uses data records for functions such as print merges. You can't use the Import or Export Tools to exchange word processing fields from VA FileMan files, however.

How Data is Moved Between Applications

Movement of data between applications that do not "speak the same language" is a complex process because it involves coordinating activities in different computer applications and often in multiple computing environments.

VA FileMan's **Import** and **Export Tools** use ASCII data exchange. It is the oldest and most widely supported way of exchanging data between applications. Data for a particular record or group of records can be transported in one of two standard formats:

- Delimited
- Fixed-length

To **export** data from a VA FileMan file, use the **Export Tool** to create an ASCII data file containing exported records. The exported data is formatted in such a way that it can be recognized by the particular foreign application. The ASCII data file can then be imported into the foreign application.

To **import** data to a VA FileMan file, use your foreign application to generate an ASCII data file containing records in either delimited or fixed-length formats. Then use the **Import Tool** to load those records into the VA FileMan file you specify.

Dependency on Correct Data Communication

For import or export of data to succeed, the data must be passed correctly on all communication pathways between VA FileMan and the foreign application. A glitch in the communication of data can cause data exchange to fail.

For example, suppose the foreign application expects the fields in records you are exporting to be separated (or "delimited") by the Tab character (<**TAB**>). The Export Tool can output a <**TAB**> between each field's data value. However, if you use a communication program's screen capture facility to create a file of the exported data and if that communication program automatically changes <**TAB**>s into a certain number of spaces to align text, the exported data will be corrupted and the import will fail.

You should be familiar with your importing or exporting application and with any communications programs that you are using. Knowledge of all the applications involved, starting with VA FileMan and its Import and Export Tools, increases the likelihood of a successful transfer of data.

Data Formats

Delimited Data Format

Suppose you have a record with LASTNAME = "Smith", FIRSTNAME = "Jane", AGE = "36". In delimited data format, you choose a delimiter character to place between field values. Let's use a comma as the delimiter character.

A comma (",") is then inserted between each of a record's fields, to "delimit" them. The resulting record, exported in comma-delimited format, would look like:

```
Smith,Jane,36
```

Figure 1: An Example of a Record Delimited by a Comma

Groups of records are exported line-by-line, one line after another. A file of records in comma-delimited format might look like:

```
USER,TEST,1 GREEN LANE,, ,Amherst,NH,03012
JONES,SUSAN,30 Plaza Court,, ,San Francisco,CA,94105
SMITH,JOE,90 123rd St.,,,San Francisco,CA,94112
```

Figure 2: An Example of a File with Records Delimited by a Comma

In order to use delimited data format, both applications (the exporting application and the importing application) must be able to recognize the format.

Quoted Fields in Delimited Format

Now suppose in the previous example that instead of two separate fields for LASTNAME and FIRSTNAME, there is only a single NAME field for both. Suppose that incoming data you want to place in the single NAME field comes in the form SMITH,JOE, but you still want to use commas as your delimiter. You can use the "Fields Quoted" setting in the Import form (or the Quote Non-Numeric Fields setting in a Foreign Format) to ignore the delimiter if it is between quotes in the incoming data.

Thus, if you set "Fields Quoted" to YES in your import form, and you pass in a record that looks like:

```
"SMITH,JOE",90 123rd St.,.,.,San Francisco,CA,94112
```

Figure 3: An Example of a Record Where the Delimiter Between Quotes will be Ignored

For quoted fields, like "SMITH,JOE", the Import Tool will ignore the comma delimiter in-between the quotes and treat "SMITH,JOE" as a single field value.

Fixed-Length Data Format

In fixed-length data format, a standard width is expected for each field in the record. Suppose, for example, you have a record with LASTNAME = "Smith", FIRSTNAME = "Jane", AGE = "36". 25 characters might be set aside for LASTNAME, 20 characters for FIRSTNAME, and 3 characters for AGE. The resulting record, exported in fixed-length format, would look like:

```
Smith           Jane           36
```

Figure 4: An Example of a Fixed-Length Record

Groups of records are exported line-by-line, one line after another. A file of records in fixed-length format might look like:

```
USER           TEST           29
JONES          SUSAN          47
SMITH          JOE            38
```

Figure 5: An Example of a File with Fixed-Length Records

In order to use fixed-length data format, both applications (the exporting application and the importing application) must be able to recognize the format.

How to Export Data

The following menu (Figure 6) shows the options used to export data:

VA FileMan ...	[DIUSER]
Other Options ...	[DIOTHER]
Data Export to Foreign Format ...	[DDXP EXPORT MENU]
Define Foreign File Format	[DDXP DEFINE FORMAT]
**> Locked with DDXP-DEFINE	
Select Fields for Export	[DDXP SELECT EXPORT FIELDS]
Create Export Template	[DDXP CREATE EXPORT TEMPLATE]
Export Data	[DDXP EXPORT DATA]
Print Format Documentation	[DDXP FORMAT DOCUMENTATION]

Figure 6: Data Export Options

If you know how to print file entries, you already know most of the procedures to export file entries. The Export Tool is based on the standard VA FileMan Print File Entries option.

For more information on the Print File Entries option, please refer to the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

The Export Tool creates a specially formatted print output. Some limitations apply to data exports that do not apply to setting up a regular print (e.g., WORD-PROCESSING-type fields cannot be exported). Some capabilities are available when exporting that are not when you are printing (e.g., the records you export can be longer than 245 characters, if you are using a delimited format—see the description of the Maximum Output Length FOREIGN FORMAT attribute below). These differences are discussed below.

The steps to export data are:

1. Make sure there is a FOREIGN FORMAT file entry available to export your data in the format expected by the receiving application.
2. Select the fields you want to export (Select Fields for Export option). This creates a SELECTED EXPORT FIELDS template.
3. Create an EXPORT Template. This is where you combine the SELECTED EXPORT FIELDS template with a desired FOREIGN FORMAT.

4. Export Data option. This is where you select which entries to export, and perform the export.

1. Make Sure a FOREIGN FORMAT File Entry is Available

First, you need to determine an ASCII data format (some form of delimited or fixed-length) that your foreign application will recognize. This is the format you will need the Export Tool to generate.

This data format must be set up in advance, as an entry in the FOREIGN FORMAT file (#.44). The following are the major format parameters stored in a FOREIGN FORMAT file entry:

- What delimiters are used between fields?
- Does the export use fixed length fields?
- What headers to output before the body of the data, and what footers after the data
- Any special formatting for specific DATA TYPEs (like dates and numbers)?

Some formats are already set up in advance in the FOREIGN FORMAT file, targeted towards specific foreign applications. These include:

- Word Data File (Comma)
- Excel (Comma)
- Excel (Tab)
- 1-2-3 Import Numbers
- 1-2-3 Data Parse
- Oracle (Delimited)

Keep in mind that applications are often updated. A format that worked for one version may not work for a different version, or a more efficient, simpler format might be possible for a different version.

The full details of the export parameters that can be set up for exporting are described in the FOREIGN FORMAT File Attributes Reference section.

In many cases, you will be able to use an existing FOREIGN FORMAT file entry for your export. If you need to create a *new* FOREIGN FORMAT file entry (rather than

using an existing entry), set up the new entry with the Define Foreign File Format option.

2. Select Fields for Export Option

In the previous step, you determined the data format for your export, and made sure there was a corresponding FOREIGN FORMAT file entry. The next step is to choose what file and field data to export. Do this using the Select Fields for Export Option; this creates a SELECTED EXPORT FIELDS template.

The process of creating a SELECTED EXPORT FIELDS template is very similar to the way you choose fields for printing with the Print File Entries option.

For details on selecting fields, please refer to the "Choosing Print Fields" topic in the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

First, you must identify the file from which you are exporting data. This is the primary file. Then you choose from which fields to export data.

In addition to fields from that file and its Multiples, you can export data from other files by using the extended pointer syntax.

For more information on pointer syntax, please refer to the "Relational Navigation" chapter in this manual.

Also, you can put other computed expressions at the "EXPORT FIELD:" prompt to make use of VA FileMan functions or M code.

There are several kinds of specifications that are valid at the "PRINT FIELD:" prompt that are *not* allowed at the "EXPORT FIELD:" prompt. They are:

- WORD-PROCESSING-type fields.
- "ALL" signifying all the fields in a file.
- Print qualifiers following the field designation (like ";X" or ";C22").
- Statistical print qualifiers preceding the field (like "#" or "&").

Import and Export Tools

- Backward extended pointers.
- Relational jumps to other files (i.e., use of a terminating colon); instead, use the full extended pointer syntax to obtain data from other files.
- Specifications that return more than one value (e.g., a Multiple in a pointed-to file); you can specify Multiples in the primary file.

After you enter a set of field specifications, you are immediately prompted for a template in which to store the selected fields. You *must* store your field specifications in a template to proceed with the next step in the data export. After you specify a template name for the SELECTED EXPORT FIELDS template, you have completed this step.

The following is an example of the "EXPORT FIELD:" dialogue. The example uses the sample PATIENT file. Several unacceptable responses are shown; the error messages are the ones you would receive to these responses:

```
Select VA FileMan OPTION: OTHER OPTIONS
Select OTHER OPTION: DATA EXPORT TO FOREIGN FORMAT

Select DATA EXPORT TO FOREIGN FORMAT OPTION: SELECT FIELDS FOR EXPORT

OUTPUT FROM WHAT FILE: PATIENT

FIRST EXPORT FIELD: NAME;S

SORRY. You cannot add ;S to the export field specifications.

FIRST EXPORT FIELD: NAME
THEN EXPORT FIELD: INTERNAL (SEX)
THEN EXPORT FIELD: RELIGION:

SORRY. You cannot jump to another file when selecting fields
for export.

THEN EXPORT FIELD: $E(RELIGION:CLASSIFICATION,1,5)
THEN EXPORT FIELD: DIAGNOSIS <RET> (multiple)
  THEN EXPORT DIAGNOSIS SUB-FIELD: DIAGNOSIS
  THEN EXPORT DIAGNOSIS SUB-FIELD: HISTORY <RET> (word-processing)

SORRY. You cannot choose a word processing field for export.

  THEN EXPORT DIAGNOSIS SUB-FIELD: AGE AT ONSET
  THEN EXPORT DIAGNOSIS SUB-FIELD: <RET>
THEN EXPORT FIELD: <RET>
STORE EXPORT LOGIC IN TEMPLATE: PATIENT TEST
  Are you adding 'PATIENT TEST' as a new PRINT TEMPLATE? No// Y <RET> (Yes)

Select DATA EXPORT TO FOREIGN FORMAT OPTION:
```

Figure 7: Creating the SELECTED EXPORTED FIELDS Template

SELECTED EXPORT FIELDS templates are sometimes referred to as PRINT templates in the user dialogue. This is because they are stored in the PRINT TEMPLATE file (#.4).

Even though you cannot "jump" to the RELIGION file (#13) using the RELIGION field, which is a pointer to the RELIGION file, you can retrieve data from that file by using extended pointer syntax.

For more information on pointer syntax, please refer to the "Relational Navigation" chapter in this manual.

You can edit a SELECTED EXPORT FIELDS template. The editing must occur in the Export Data option, *not* in the standard Print File Entries option. To edit one, enter the template name at the "FIRST EXPORT FIELD:" prompt preceded by a left bracket ("[").

If an EXPORT template (see the next step) has been created based on the SELECTED EXPORT FIELDS template that you edit, the SELECTED EXPORT FIELDS template will *not* be updated to reflect the changes. You must create a new SELECTED EXPORT FIELDS template to make use of the changes.

3. Create Export Template Option

The next step to export data is to create an EXPORT template with the Create Export Template option. The EXPORT template combines the SELECTED EXPORT FIELDS template (created in Step 2 above) with a FOREIGN FORMAT (see Step 1 above).

Besides choosing a SELECTED EXPORT FIELDS template and a FOREIGN FORMAT, you will be asked for any additional information that is needed to fully define the export. If you do not supply the requested information, the EXPORT template cannot be created. Values in the FOREIGN FORMAT entry you choose determine whether or not you will be prompted for more information.

The following table indicates which values for which FOREIGN FORMAT fields will result in prompts:

Foreign Format Field	Value	Information Required
FIELD DELIMITER	"ASK"	The character or characters to separate fields.
RECORD DELIMITER	"ASK"	The character or characters to separate records.
RECORD LENGTH FIXED?	"1" or "YES"	The number of characters in each field to be exported.
NEED FOREIGN FIELD NAMES?	"1" or "YES"	The name of each field recognized by the importing application.
MAXIMUM OUTPUT LENGTH	"Ø"	The maximum number of characters on each line of output, usually the longest possible exported record.
PROMPT FOR DATA TYPE?	"1" or "YES"	The DATA TYPE of each exported field; possible choices are FREE TEXT, NUMERIC, or DATE/TIME.

Table 2: FOREIGN FORMAT Field Prompts

In the example below, the file and field specifications in the **SELECTED EXPORT FIELDS** template example (Figure 7) are combined with the 123 Import Numbers **FOREIGN FORMAT**:

```
Select DATA EXPORT TO FOREIGN FORMAT OPTION: CREATE EXPORT TEMPLATE

OUTPUT FROM WHAT FILE: PATIENT <RET> (10 entries)

Enter SELECTED EXPORT FIELDS Template: PATIENT TEST
**SELECTED EXPORT FIELDS** (OCT 30, 1992@11:32) USER #7 FILE #99002

Do you want to see the fields stored in the PATIENT TEST template?
Enter Yes or No: NO// YES

FIRST PRINT FIELD: NAME// <RET>
THEN PRINT FIELD: INTERNAL(SEX)// <RET>
THEN PRINT FIELD: $E(RELIGION:CLASSIFICATION,1,5)// <RET>
THEN PRINT FIELD: DIAGNOSIS// <RET>
  THEN PRINT DIAGNOSIS SUB-FIELD: DIAGNOSIS// <RET>
  THEN PRINT DIAGNOSIS SUB-FIELD: AGE AT ONSET// <RET>
  THEN PRINT DIAGNOSIS SUB-FIELD: // <RET>
THEN PRINT FIELD: // <RET>

Do you want to use this template?
Enter Yes or No: YES// <RET>

Do you want to delete the PATIENT TEST template
after the export template is created?
Enter Yes or No: NO// <RET>
```

Figure 8: Creating the EXPORT Template

When asked if you want the **SELECTED EXPORT FIELDS** template deleted, answer **YES** only if you know you won't need the template again. If an **EXPORT** template is not successfully created, the **SELECTED EXPORT FIELDS** template will not be deleted.

Next, identify the **FOREIGN FORMAT** to use, and name the **EXPORT** template that you're creating. You can't overwrite an existing **PRINT** template:

```
Select FOREIGN FORMAT: 123 IMPORT NUMBERS <RET> **DISTRIBUTED BY VA FILEMAN**

Enter name for EXPORT Template: PATIENT TO 123
Are you adding 'PATIENT TO 123' as
  a new PRINT TEMPLATE (the 197TH)? No// Y <RET> (Yes)
```

Figure 9: Identifying the FOREIGN FORMAT and EXPORT Template

After you choose the EXPORT template name, you are prompted for any additional information needed. In this example, the format does require additional information: the DATA TYPE for each field (in this situation the defaults derived by the Export Tool are correct) and the maximum length of each record:

```
Enter the data types of the fields being exported below.

Do you want to continue?
Enter Yes or No: YES// <RET>

NAME: FREE TEXT// <RET> FREE TEXT
INTERNAL(SEX): FREE TEXT// <RET> FREE TEXT
$(RELIGION:CLASSIFICATION,1,5): FREE TEXT// <RET> FREE TEXT
DIAGNOSIS in DIAGNOSIS subfile: FREE TEXT// <RET> FREE TEXT
AGE AT ONSET in DIAGNOSIS subfile: NUMERIC// <RET> NUMERIC

Enter the maximum length of a physical record that can be exported.
Enter '^' to stop the creation of an EXPORT template.

MAXIMUM OUTPUT LENGTH: 100

Export Template created.
```

Figure 10: Entering DATA TYPES in an EXPORT Template

The Export Tool checks to make sure that your SELECTED EXPORT FIELDS template does not contain fields from Subfiles (Multiples) that are not descendent from each other.

For more information on Subfiles (Multiples), please refer to the "Exporting Data From Multiples" topic in this section.)

If you have not followed that restriction, you will receive an error message. The SELECTED EXPORT FIELDS template would have to be modified.

4. Choose Entries/Export Data

In the final step to export data, use the Export Data option to select which entries from the file to export, and then perform the export.

First, choose which entries to export with a "SEARCH" dialogue; then choose the order of the exported entries with a "SORT BY" dialogue (you are not given the "SORT BY" dialogue, if you are exporting fields from Subfiles.) Finally, specify the device to send the exported data to.

During either the Search or Sort process, you can use previously created SEARCH and SORT templates. Those templates need not have been originally made during a data export; however, SORT templates that contain unacceptable qualifiers should not be used. At the "SORT BY:" prompt, you can only use the following subset of sort qualifiers:

Sort Qualifier	Description
,	To not sort. Used when you want to use the "FROM ... TO" dialogue to restrict the entries to be exported.
-	To sort in reverse order.
;Ln	To sort on the first n-characters only.
;TXT	To sort following strict ASCII sorting sequence.

Table 3: Allowable Sort Qualifiers When Exporting Data

The "Print: How to Print Reports from Files" and "Search" chapters of the *VA FileMan Getting Started Manual* contain more detailed information about searching and sorting.

Export Example

Here is an example of an export using the "PATIENT TO 123" EXPORT template created in the previous section (Figure 9 and Figure 10). You begin by identifying the file and the EXPORT template that you want to use for the export. Do *not* enclose the template's name with brackets. Again, you can delete the EXPORT template after a successful export, if you want.

Because there is a Multiple involved, you are told that you will not have the opportunity to sort. Then, you are given the opportunity to search the file for entries to export.

```
Select DATA EXPORT TO FOREIGN FORMAT OPTION: EXPORT DATA

OUTPUT FROM WHAT FILE: PATIENT// <RET>

Choose an EXPORT template: PATIENT TO 123 <RET>      **EXPORT**
                        (OCT 30, 1992@15:08) USER #7 FILE #99002

Do you want to delete the PATIENT TO 123 template
after the data export is complete?
Enter Yes or No: NO// <RET>

Since you are exporting fields from multiples,
a sort will be done automatically.
You will not have the opportunity to sort the data before export.

Do you want to SEARCH for entries to be exported? NO// YES

-A- SEARCH FOR PATIENT FIELD: DATE OF BIRTH
-A- CONDITION: < <RET> LESS THAN
-A- LESS THAN DATE: 1980 <RET> (1980)

-B- SEARCH FOR PATIENT FIELD: <RET>

IF: A// <RET> DATE OF BIRTH LESS THAN 1980 (1980)

STORE RESULTS OF SEARCH IN TEMPLATE: <RET>
```

Figure 11: Searching for Entries to be Exported

If Multiples had not been involved, you would now be able to respond to the SORT BY dialogue. You can do the same things with sort here that you can do when using the Print File Entries option.

What Device to Send Export Data To

After you complete the sort dialogue, you are immediately given the "DEVICE:" prompt. Choose what device the exported data should be sent to:

```
DEVICE: <RET>
```

Figure 12: Choosing a Device to Send Exported Data

If you press the Enter/Return key at the "DEVICE:" prompt, the export output will be displayed on your *screen*. Sending the formatted export data to the screen allows you to use a PC-based screen capture to put the data into a file. This file would be a readable ASCII file on that computer. This method of transferring the data into a file is a simple one that will often be successful and convenient, especially if the importing application is on the same PC.

When using a screen capture to create a file from the exported data, you must consider the peculiarities of your communication and terminal emulation software. Your communication application, for example, may intercept certain control characters (like the <TAB>, ASCII 9) and convert them into something else. This may cause the import to fail. Also, your terminal emulation may automatically "break" lines at 80 characters by inserting an unwanted carriage return or line feed. When emulating VT-100 and other ANSI terminals, you can avoid this last problem by turning wraparound mode off.

When exporting data to your terminal's screen, there will be no page breaks. Therefore, there is no graceful way to interrupt the export once it has begun.

Sending Export Data to a Host File

Having data printed on-screen is of little use, if you are using a terminal with no screen-capture capabilities. An alternative is to send the data to a file on the host system, for example, to a VMS file if you are using DSM. Another advantage to sending data to a Host file is that only the exported data will be in the file. (Often, screen captures will unavoidably contain extraneous parts of the user's dialogue prior to or after the export.) To export your data to a file, at the "DEVICE:" prompt, send your export output to an HFS-type device.

Your IRM should be able to help you, if you're not sure how to use HFS devices. The *Kernel Systems Manual* also describes how to send output to Host files, including how to set up and use HFS-type devices.

When a Host file is created, you must move that ASCII file to the computer on which the importing application resides. A file transfer protocol, such as KERMIT or XMODEM, can be used to move this file.

The export can be queued, if it is not sent to the screen. Queuing the export is recommended for large files and for complex sorts of the data.

i **On HFS Device Setup on OpenVMS Systems:** DSM for OpenVMS requires that you add a command parameter to the OPEN command, if you export records longer than 512 characters to a Host file. The parameter is RECORDSIZE=nnnn, where "nnnn" is greater than the longest record that you are exporting. If you are using Kernel's DEVICE file (#3.5), the OPEN PARAMETER field for the HFS device you are using should be edited to look like "(NEW:RECORDSIZE=nnnn)".

Sample Output

The data below has been prepared for import by Lotus 1-2-3, so it need not be easily read by people. However, you can see that text fields are surrounded by quotes; empty text fields consist just of two quotes (""). A space is in between each field's value. Numeric values have no quotes. If a field defined as numeric in the VA FileMan data dictionary has no value, a zero (0) is output because this format has SUBSTITUTE FOR NULL set to "0".

```
"GREEN,ARNOLD" "m" "PROTE" "GANGRENE" 45
"RED,MARCIE" "f" "CATHO" "SLEEPING SICKNESS" 28
"BLUE,THOMAS" "m" "PROTE" "CIRRHOISIS" 25
"BLACK,MICHELLE" "f" "OTHER" "FLU" 34
"YELLOW,TOMMY" "m" "" "BLOOD POISONING" 44
"GREEN,ARNOLD" "m" "PROTE" "GUN SHOT " 50
"BLACK,MICHELLE" "f" "OTHER" "FLU" 37
"YELLOW,TOMMY" "m" "" "FLU" 0
"BLACK,MICHELLE" "f" "OTHER" "FLU" 46
"BLACK,MICHELLE" "f" "OTHER" "APPENDICITIS" 39
```

Figure 13: An Example of Exported Data

Special Considerations: Exporting Numbers

If a number comes from a field in your primary file that is defined as NUMERIC or COMPUTED, that number will be exported with all leading spaces or trailing insignificant zeros removed. This is different from the way that the regular VA FileMan Print File Entries works. If the field had a value of zero, the character zero (0) will be exported. If the value of a numeric field in the primary file is null, the exported value will depend on the contents of the SUBSTITUTE FOR NULL field for the format being used.

If a number comes from a source other than a NUMERIC or COMPUTED DATA TYPE in the primary file, it can be output with leading spaces or trailing insignificant zeros. Such a number might originate from a field in a pointed-to file reached by the relational syntax, a VA FileMan function, or other computed expression. In these cases, the value of the SUBSTITUTE FOR NULL field will usually have no effect on what is exported.

Whether exported numbers have leading spaces or trailing insignificant zeros and whether nulls produce special output is controlled by how the field is defined in the VA FileMan data dictionary. The DATA TYPE input by the user when the PROMPT FOR DATA TYPE? field contains YES does *not* affect these characteristics of the export.

Special Considerations: Multiples

EXPORTING DATA FROM MULTIPLES

Data Flattening

Data exported from Multiples is "flattened;" that is, data at upper levels is repeated for each subentry. For example, take the comma-delimited export for a top level file's #.01 NAME field and a Subfile's #.01 DATE and #1 TYPE fields. The output for an entry with four subentries would look like:

```
SMITH,01-JAN-95,SC
SMITH,24-JUN-95,NSC
SMITH,14-AUG-95,SC
SMITH,21-JUL-96,NSC
```

Figure 14: An Example of Data Flattening When Exporting Data from Multiples

The top level .01 field is repeated for each Subfile entry.

No More Than One Multiple at Any One File Level

You can't export *more than one Multiple at any one file level*. You can export data from one Multiple and from Subfiles directly descendent from that Multiple (as long as you never export more than one Subfile at the same level). Suppose you're exporting data from a file with the following structure:

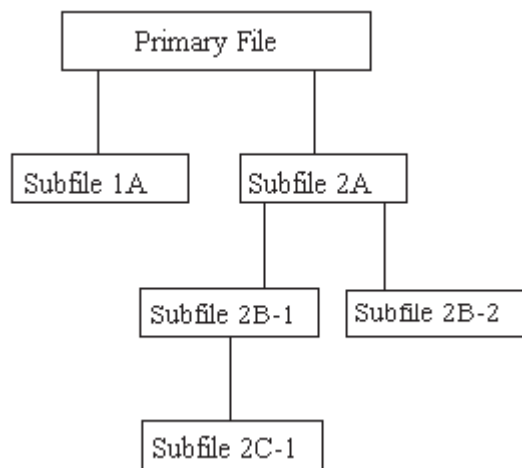

Figure 15: An Example of a File Structure

In addition to fields in the Primary file, you can export from Subfile 1A *or* Subfile 2A, but not from both. Also, you can export from Subfile 2A, Subfile 2B-1, and Subfile 2C-1, but you could not additionally choose fields in Subfile 2B-2. If you need data from Subfiles that are not directly descendent from each other, you can do multiple exports and "join" the data together in the importing application.

Sorting with Multiples

A special, automated sort is done to the data when Multiples are exported; you *cannot* perform your own sort. When Subfiles are involved, the Export Tool performs a special sort in order to format the data. Since the Export Tool must do this customized sort, you cannot sort the data yourself. If you need the data in a particular sequence, sort it in the importing application. You can perform any search on the data that is necessary to choose entries for export.

About EXPORT Templates

The Export Tool uses two types of templates: the EXPORT FIELDS template (created in Step 2) and the EXPORT template (created in Step 3). These templates are variations on standard PRINT templates. They are stored in the PRINT TEMPLATE file (#.4) and are sometimes referred to as PRINT templates in the user dialogue. Although similar to PRINT templates, they do differ in important respects. For example, you *cannot compile* either of the Export Tool's templates.

You can delete these templates as soon as they are used if you wish. Also, both kinds of templates can be deleted using the Template Edit option on the Utility Functions submenu. In addition, you can delete an EXPORT FIELDS template by choosing the template within the Select Fields for Export option, editing it, and putting an at-sign ("@") at the "NAME:" prompt. Do *not* delete an EXPORT template before a queued export has been completed.

Import and Export Tools

How to Import Data

The following menu (Figure 16) shows the option used to import data:

Figure 16: Data Import Option

The Import Tool lets you import records stored in an ASCII data file into a VA FileMan file.

The Import Tool imports records from an ASCII data file by *adding* them as new records to the VA FileMan file in question. Existing records in the destination VA FileMan file are never edited or updated, and the Import Tool does not prevent duplicate records from being added.

Importing data records from an ASCII file is a four-step process, as described below.

1. Generate ASCII Source File

Generate your source file (from your non-VA FileMan application), containing the records to be imported. Generate the file with one record per line, with the fields in each record being set off using either the delimited or fixed-length method. The last record in the file must be terminated with the appropriate EOL (end-of-line) character(s) for your operating system.

Once you generate your ASCII source file, you need to move it to a disk that is accessible from the computer system running VA FileMan. Your IRM should be able to assist you with this.

2. Specify Data Format, Source File, and Destination File

Invoke VA FileMan's Import Data option. It loads a two-page ScreenMan form. On page one of the form, you need to specify the: data format, source file, and destination file for your import.

DATA FORMAT—INTERNAL or EXTERNAL: Specify if the incoming data is in external form (the way VA FileMan would display it) or internal form (the way VA FileMan would store it). Unless you are knowledgeable about how VA FileMan stores data, you should choose EXTERNAL. Also, the incoming data is only validated by VA FileMan if you choose EXTERNAL (validation prevents you from putting invalid data into the file).

FOREIGN FORMAT: Choose a Foreign Format entry whose settings match the ASCII format for the incoming records. The only settings used from the Foreign Format entry are Record Delimiter, Record Length Fixed?, and Quote Non-numeric Fields?. Make sure the settings in the Foreign Format match the format of your incoming data. Because some foreign applications export data in a different format than they import it, a Foreign Format that works for export may not have the appropriate settings for import.

As an alternative to specifying a Foreign Format entry, you can manually specify the settings for your incoming data in the three provided fields:

1. Is the data fixed length?
2. If not, what is the field delimiter?
3. Are fields quoted?

SOURCE FILE: Enter the path and name of your source file (the file containing the records to import).

VA FILEMAN FILE: Specify the destination file for the imported records.

FIELD SELECTION PAGE/IMPORT TEMPLATE: This is where you match the fields in the incoming records to the fields in the destination file. If you don't have an existing IMPORT template that matches incoming to destination fields, go to the Field Selection page and specify those fields individually (see Match Source to Destination Fields below).

A completed page one of the form might look like:

```

                                DATA IMPORT                                Page 1
                                =====

                                DATA FORMAT                                SOURCE FILE
                                -----                                -----
Internal or external: EXTERNAL                                Full path: USER$: [SMITH]
                                                                Host file name: IMPORT.DAT

                                Foreign format: EXCEL (COMMA)
                                                                OR
                                Data fixed length?
                                Field delimiter:
                                Fields quoted?

                                                                VA FILEMAN FILE
                                                                -----
                                                                Primary file: NEW PERSON

                                                                Field selection page...
                                                                OR
                                                                Import Template:

-----

COMMAND:                                                                Press <PF1>H for help    Insert
    
```

Figure 17: An Example of a Completed Import Form

3. Match Source to Destination Fields

For your import, you need to match each field in the incoming record to a field in the destination VA FileMan file.

Fields in the incoming record are imported in order, from left to right. Thus, for each field in the incoming record, you specify the corresponding destination field in the VA FileMan file, in the same order. The first VA FileMan field you specify will be the destination for the first field in the incoming record, the second will match the second field in the incoming record, and so forth.

```

                                FIELD SELECTION FOR IMPORT
                                =====
                                Page 2

Choose a field from
NEW PERSON
  Field:                               Delete last field selected?

These are the fields selected so far:
  1 - NAME
  2 - STREET ADDRESS 1
  3 - STREET ADDRESS 2
  4 - STREET ADDRESS 3
  5 - CITY
  6 - STATE
  7 - ZIP CODE

-----

COMMAND:                               Press <PF1>H for help   Insert

```

Figure 18: An Example of Fields Selected for Import

Remember that you must include the .01 field, and any fields that are required identifiers for the top level of the file. The same is true for any Subfiles (Multiples). If you specified a fixed-length (as opposed to delimited) data format for the incoming records, you must enter not only the destination VA FileMan field, but also the length for each corresponding incoming field.

Each time you enter a field at the "Field:" prompt, it's added to the bottom of the list of fields displayed on the form. This shows you the destination fields you've selected, and their order. If you make a mistake, you can delete fields from the bottom of the list, one-by-one, by entering YES at the "Delete last field selected?" prompt. To insert a field, delete back to the insertion point, enter the new field, and then re-enter the deleted fields.

There are special issues when importing data into fields in Multiples (see the Special Considerations: Multiples section).

You can save the information you specify on the Field Selection page in an IMPORT template. This lets you reuse the field matching criteria you have entered for subsequent imports that use the same file and fields, without having to re-enter it. To save your field specifications as an IMPORT template, answer YES to the "Do you want to store the selected fields in an Import Template?" question, which you're asked after you exit the Import form (see Run the Import below). Then, for future imports, simply enter the name of the IMPORT template on Page 1 of the Import form. You can use any IMPORT template to which your VA FileMan Access Code gives you access.

4. Run the Import

Once you've set up your data format, source file, and destination file, and matched source to destination fields, exit the Import form (press <PF1>E). After you exit the form, you're asked a series of questions:

1. Do you want to store the selected fields in an Import Template?
2. Do you want to proceed with the import?
3. Device for Import Results Report

Storing your file and field specifications in an IMPORT template lets you do subsequent imports without having to re-enter all of the field information.

If you proceed with the import, enter a device to which the Import Results report should print. You can run the Import directly or queue it.

As the import proceeds, if an error occurs updating a field in a particular record, the record won't be added, and an error message is added to the Import Report saying what the problem was.

An example of the dialogue after exiting the Import form is shown below:

```
Do you want to store the selected fields in an Import Template? YES

Name of Import Template: ZZIMPORT
  Are you adding 'ZZIMPORT' as a new Import Template? YES

Do you want to proceed with the import? YES

Device for Import Results Report: HOME// <RET> SYSTEM
```

Figure 19: Exiting the Template Form and Performing the Import

Once the import finishes, you can review the Import Results report. It lists:

- The criteria you chose for your import.
- Any records for which the import failed.
- The internal entry numbers of the first and last records imported.

Here's a sample Import Results report:

```

                                Log for VA FileMan Data Import                                Page 1
                                =====

                                Import Initiated By: JOHN SMITH

                                Source File: USER$:[SMITHJ]IMPORT.DAT
                                Fixed Length: NO
                                Delimited By: ,
                                Text Values Quoted: NO
                                Values Are: External

                                Primary FileMan Destination File: NEW PERSON

Seq  Len  Field Name                               Subfile Name (if applicable)
---  ---  -
1    n/a  NAME

                                Import Filing Started: Jul 16, 1996@08:24:36
                                Import Filing Completed: Jul 16, 1996@08:24:38
                                Time of Import Filing: 0:00:02
    
```

Figure 20: An Example of an Import Results Report

In this example, six records were added, and one record was not added. The record that was not added was the fourth record in the source file. It failed due to the misspelled value "Illlinois" being rejected by the STATE field in the NEW PERSON file (#200).

Special Considerations: Multiples

IMPORTING DATA INTO MULTIPLES

Incoming Data Should *Not* be Flattened

The Import Tool expects that any data bound for a Multiple be contained in the same import record (line of data) as the data for the top file level. This is different from the output of the Export Tool, which "flattens" exported data from Multiples into separate lines of output.

For example, consider a comma-delimited import of records, each including a name plus four subentries. Each subentry contains a DATE and a TYPE. The records will be imported into a file with a top-level #.01 NAME field, and a Multiple with #.01 DATE and #1 TYPE fields. For this import, you would choose the destination fields as follows:

```

                                FIELD SELECTION FOR IMPORT
                                =====
                                Page 2

Choose a field from
PATIENT : DATE   Subfile
Field:                               Delete last field selected?

These are the fields selected so far:
 1 - NAME
 2 - DATE:DATE
 3 - DATE:TYPE
 4 - DATE:DATE
 5 - DATE:TYPE
 6 - DATE:DATE
 7 - DATE:TYPE
 8 - DATE:DATE
 9 - DATE:TYPE

-----
Exit      Save      Next Page      Refresh

Enter a command or '^' followed by a caption to jump to a specific field.

COMMAND: NEXT                                Press <PF1>H for help      Insert
    
```

Figure 21: An Example of Fields Selected for Import to a Multiple

A corresponding line of data to be imported for a record, containing data for both the top-level record and its subentries, would look like:

```
SMITH, 01-JAN-95, SC, 24-JUN-95, NSC, 14-AUG-95, SC, 21-JUL-96, NSC
```

Figure 22: An Example of Data Not Flattened When Importing Data to a Multiple

You must file the same number of subentries in each record you import.

Completeness of Subfile Entries

New subentries need to be added to every Subfile on a path to the lowest level Subfiles. Your data must include values for the .01 field and all the required identifiers for every Subfile (as well as for the top level of the file). You can add more than one subentry in a particular Subfile. However, you are restricted to the same set of fields for every entry in each Subfile.

Importing from VMS Files

When importing from a data file that's been transferred to a VMS-based computer system, a problem can occur if, once transferred, the data file does not get a maximum record length stored in its file header. This can happen when a DOS file is moved to a VMS system by some protocols. When the maximum record length is unknown, VMS uses a default maximum size of 510. If the length of a data record in the source file is larger than the maximum size, an error results.

The solution is to run the VMS CONVERT utility on the Host file. This utility adds the maximum record information to the file header and everything will work just fine!

You can see if the maximum record length is stored in a file's header on a VMS system, by using the following DCL command:

```
DIR filename /FULL
```

Figure 23: Verifying the Maximum Record Length on a VMS System

Import and Export Tools

Foreign Formats

FOREIGN FORMAT File Attributes Reference

The following fields in the FOREIGN FORMAT file correspond to attributes of the formatted data that you wish to export or import:

- FIELD DELIMITER
- QUOTE NON-NUMERIC FIELDS?
- SEND LAST FIELD DELIMITER?
- PROMPT FOR DATA TYPE?
- RECORD DELIMITER
- SUBSTITUTE FOR NULL
- RECORD LENGTH FIXED?
- DATE FORMAT
- MAXIMUM OUTPUT LENGTH
- FILE HEADER
- NEED FOREIGN FIELD NAMES?
- FILE TRAILER

When *exporting* records, all fields in this file are used in the export process. When *importing* records, only three fields are used in the import process:

- FIELD DELIMITER
- RECORD LENGTH FIXED?
- QUOTE NON-NUMERIC FIELDS?

In this section, each format characteristic is described. Some combinations of characteristics are unacceptable; these situations are mentioned.

Also, some of the fields allow you to enter M code. Export-specific variables you can use in this M code are described in the section Variables Available for Programmer Use.

To set up a FOREIGN FORMAT file entry, use the Define Foreign File Format option; to print out a format, use the Print Format Documentation option.

FIELD DELIMITER

Many applications can import and export data, if the values of fields in each record are separated by a known character or sequence of characters. The application puts (or expects) data before the first delimiter into its first field, between the first and second delimiter into the second field, and so on. Therefore, the ability to specify and recognize these field delimiters is a crucial aspect of many data exchanges.

The Import and Export Tools' FIELD DELIMITER fields allow you to specify up to 15 characters to be placed between each field. You can directly enter any string of characters except ones that begin with a number or consist of characters that have special meaning when editing VA FileMan data (e.g., "^" or "@").

If your field delimiter begins with one of these restricted characters or consists of an unprintable control character (like <TAB>), you can enter the ASCII-value of the delimiter. When entering the ASCII values, always use three digits. Thus, <TAB> (ASCII 9) becomes "009" and "@" (ASCII 64) becomes "064". You can enter up to four ASCII values. If more than one is needed, separate the values with commas (e.g., "048,094").

If you want the user to be prompted for a field delimiter at the time the EXPORT template is being created, enter "ASK" in this field.

Using unprintable control characters (ASCII values less than 32) as delimiters may not have the effect you want. During either export or import, often control characters are intercepted by terminal software, communication programs, or network links; they may not be passed through unaltered as regular printable characters usually are. For example, ASCII value 5 is interpreted by many terminals as a request for their Answerback Message. Thus, putting "005" in the FIELD DELIMITER field might cause an Answerback Message to be returned by your terminal instead of the ASCII value 5 being inserted between field values.

The importing application will find the delimiting character, if it occurs in the data. This will cause an incorrect determination of the boundary between fields. For example, if a comma (,) is the field delimiter and the data for a field was **Smith,John**, the importing application would put **Smith** into the first field and **John** into the second field. You can avoid this problem by specifying that data in non-numeric fields be surrounded by quotes (e.g., "**Smith,John**"). Most importing applications will ignore delimiters, if they occur within a quoted string. See the discussion of Quote Non-numeric Fields? below.

SEND LAST FIELD DELIMITER?

Some importing applications expect a field delimiter following every field, including the final field in a record. Other applications only expect delimiters between fields; nothing follows the final field. This field allows you to specify whether or not a field delimiter should be exported after the last field. A YES answer sends the delimiter, a NO answer does not.

The contents of this field does *not* affect whether or not a delimiter is sent after each *record*.

RECORD DELIMITER

Applications that import delimited fields need to know when one record ends and a new one begins. In most cases, records are separated by a carriage return (or by a line feed and a carriage return). This is the same as pressing the Enter/Return key at the end of a line. The Export Tool *automatically* puts this separator after each record; every record begins on a new line of output. You do *not* need to put the ASCII values for carriage return and line feed in this field.

Some applications may also require that additional characters be placed after each record. If this is the case, put those characters into the RECORD DELIMITER field. The requirements for coding the field are the same as for the FIELD DELIMITER field.

RECORD LENGTH FIXED?

A second common way to import and export data (in addition to using delimited data) is with fixed length records. In a fixed length record, each field has a predetermined, constant data length. For example, a name field might be 30 characters long. The name "Smith,John" is only 10 characters long; thus, 20 spaces would be added to the field value to fill the required 30 characters. The next field's value would begin in the thirty-first column.

If you want to import or export fixed length records, answer YES to this field. At the time that the EXPORT template is created (or an import is done), the user will be prompted for the length of each field in the target or source file.

During export, in most cases data will be truncated when the length of a field is reached. Thus, if a field contains 32 characters but the user-defined length is 30, the last 2 characters will not be exported. However, DATE/TIME-valued fields will always be exported in their entirety. For dates, the user *must* indicate a data length at least as long as the exported date, which is 11 characters for standard VA FileMan dates.

Fixed record lengths cannot be used in conjunction with field delimited data. Also, the *maximum record size for exports for a fixed length format is 255* characters. There is *no limit on record length during import, however.*

Fixed length exports will succeed only if all fields are exported on the same physical line. Therefore, the total of all the field lengths must not be more than the value stored in the MAXIMUM OUTPUT LENGTH field.

MAXIMUM OUTPUT LENGTH

In many cases, data import will be much easier if an entire record is contained on a single "line" of output. That is, there are no carriage returns within a single record, only between records. (This is a requirement for a successful fixed length export.)

In a regular VA FileMan print, the amount of data printed before a carriage return is dependent on the type of device being used for output—a CRT screen would normally have 80 characters on a line, a printer 80 or 132. For data export, however, the physical characteristics of the output device is not controlling. Rather,

the capabilities of the application importing data is overriding. Therefore, you can use the MAXIMUM OUTPUT LENGTH field to specify how long a physical record will be. For field delimited (as opposed to fixed length) exports, this record length can be larger than the traditional M data limit of 255 characters.

Put a number from 0 through 9999 into this field. The default record length is 80. If you want the user to be prompted for a record length at the time that an EXPORT template is being created, put "0" (zero) into this field.

Regardless of the length of the maximum record, a carriage return will be written after each record is output.

The length of a record cannot exceed 255 characters when using a fixed length format.

When sending exports to a Host file on a DSM for OpenVMS (e.g., VAX) system, you must add a parameter to the OPEN command, if any of your exported records are longer than 512 characters. See the "Export Data" section for details.

NEED FOREIGN FIELD NAMES?

If this field is answered YES, the user is prompted for a field name for each exported field when the EXPORT template is created. The field names are stored in the NAME OF FOREIGN FIELD field in the EXPORT FIELD Multiple in the PRINT TEMPLATE file (#.4). See the discussion below of the FILE HEADER field for one way to use this information.

QUOTE NON-NUMERIC FIELDS?

When *importing* data, VA FileMan will ignore the field delimiter in a quoted string when this field is set to YES.

When *exporting* data, if you want all values that do not belong to a NUMERIC DATA TYPE field to be surrounded by quotation marks, answer YES to this field.

Many importing applications treat data within quotation marks (") in a special way. Sometimes such data is automatically considered to be text, as opposed to numbers.

Also, the importer may ignore the field delimiter character, if it falls within a quoted string. Quoting a null value from a non-numeric field will result in two double quotes ("") being exported.

During export, the DATA TYPE of a field is automatically determined for fields in the primary file and its Multiples. NUMERIC DATA TYPE fields are considered NUMERIC. There may be other fields that you want treated as NUMERIC: COMPUTED-type fields with numeric results, fields referenced by the extended pointer syntax, replies to the "EXPORT FIELD:" prompt that are computed expressions with numeric results. By default, these fields are assigned a FREE TEXT DATA TYPE. If you want the user to choose the DATA TYPE when the EXPORT template is created, answer YES to the PROMPT FOR DATA TYPE? field.

If the Export Tool assigns a non-numeric DATA TYPE or if the user chooses one of those DATA TYPEs, the field's values will be surrounded by quotes when this field contains YES.

Do *not* set this field to YES if a fixed length record is being exported or imported.

PROMPT FOR DATA TYPE?

The Export Tool will determine the DATA TYPE for fields in the primary file and its Multiples based on their definition in the data dictionary. Other fields are automatically assigned a DATA TYPE of FREE TEXT. If you want the user to choose the DATA TYPE of each field when creating an EXPORT template, answer YES to this field. The only DATA TYPEs recognized by the Export Tool are FREE TEXT, NUMERIC, and DATE/TIME.

The DATA TYPE entered by the user controls whether or not the values from that field will be surrounded by quotes if the QUOTE NON-NUMERIC FIELDS? field is set to YES. The user supplied DATA TYPE does *not* affect how numbers are exported; numeric export is controlled by the DATA TYPE in the data dictionary only.

SUBSTITUTE FOR NULL

Numeric fields with no data (a "null" value) will result by default in nothing being exported for that field. For fixed record length exports, this should not be a problem. However, if your importing application uses spaces as a delimiter, you may need a printable character to be exported for null-valued numeric fields. If you want a character or characters (such as "0" or ".") substituted for numeric nulls, put them into this field. Null values for NUMERIC DATA TYPEs in the primary file (including its Multiples) will have this character exported. If you want quotes (") in your substitute string, enter two quote marks (") for each quote you want.

Do not put anything in this field when defining a fixed length format.

There will be no substitution for null values if the field being exported is not in the primary file; that is, if it is reached using relational navigation.

DATE FORMAT

The native, or default, format for dates varies from application to application. VA FileMan uses two formats: an internal, or storage, format (YYYYMMDD, where YYY is the year minus 1700) and an external, or default display, format (MON DD,YYYY). When data from a DATE/TIME DATA TYPE field is exported, it is in the external format.

Since the importing application may recognize a different format, you can change the exported value by placing M code in this field (only those with programmer access can enter code in this field.) When this M code is executed, the local variable X will contain the date in VA FileMan *internal* format. Your M code should result in the local variable Y containing the date in the format you want exported.

If your format will be used with Kernel, it is recommended that you make use of the date extrinsic functions provided by Kernel, if possible. See the *Kernel Systems Manual* for details.

Data from fields with DATE/TIME DATA TYPEs in the primary file, its Multiples, and pointed-to files is altered by the code in this field; date values from other sources is not. There is another way to change the exported output; you can use a VA FileMan function when selecting fields for export:

```
THEN EXPORT FIELD: NUMDATE (DATE OF BIRTH)
```

Figure 24: Using VA FileMan Functions When Exporting Data

The DATE FORMAT field will have no effect on that output.

FILE HEADER

Some applications require special information to process the data in the file that is imported. For example, the field names might be needed. Also, you may want to put some special data into the file for identification or documentation purposes.

The FILE HEADER field allows you to output information before the stream of exported data. This field can contain either a literal string surrounded by quotation marks (e.g., "Data for Lotus 1-2-3") or M code that, when executed, will write the desired output.

You can put M code here only if you have programmer access. The local variable DDXPXTNO, which equals the internal entry number in the PRINT TEMPLATE file (#.4) of the EXPORT template being used for data output, is defined when the code is executed. You can use this variable to access information about the export. The DATA TYPE, length, and foreign field name are stored in the EXPORT FIELD Multiple (#100).

For additional information, please refer to the data dictionary for the PRINT TEMPLATE file.

FILE TRAILER

You can use this field like the FILE HEADER field. The literal or M code will be output after the exported data.

Variables Available for Programmer Use

Some of the fields in the FOREIGN FORMAT file allow you to enter M code, if you have programmer access. You may want to use data stored in the EXPORT template entry at the time the export is performed. You may also want to access information in the FOREIGN FORMAT file entry used for the export.

Two variables are available for use in the M code entered in FOREIGN FORMAT file fields:

- **DDXPXTNO**—The internal entry number of the EXPORT template in the PRINT TEMPLATE file.
- **DDXPFFNO**—The internal entry number of the Foreign Format in the FOREIGN FORMAT file.

Consult the data dictionaries of the two files for fields that may contain useful information about either the format or the specific export itself. The EXPORT FIELD Multiple in the PRINT TEMPLATE file might be of particular interest. This Multiple contains information about each field being exported.

Print Format Documentation Option

VA FileMan ...	[DIUSER]
Other Options ...	[DIOOTHER]
Data Export to Foreign Format ...	[DDXP EXPORT MENU]
Print Format Documentation	[DDXP FORMAT DOCUMENTATION]

Figure 25: Print Format Documentation Option

You can list the available FOREIGN FORMAT file entries on the system using the Print Format Documentation option. When you use this option, you are given the choice of specifying individual formats or of printing all of the formats on your system. Since your system can contain many formats, try to select individual ones.

A typical dialogue for choosing formats and the resulting output looks like this:

```
Select DATA EXPORT TO FOREIGN FORMAT OPTION: PRINT FORMAT DOCUMENTATION

    Select one of the following:
        1          Only print selected foreign formats
        2          Print all foreign formats

Enter response: 1 <RET> Only print selected foreign formats

Select FOREIGN FORMAT: 123 IMPORT NUMBERS

Select FOREIGN FORMAT: EXCEL-COMMA

Select FOREIGN FORMAT: <RET>

DEVICE: <RET>

AVAILABLE FOREIGN FORMATS                               NOV  2,1992 15:34   Page 1
-----
NAME: 123 IMPORT NUMBERS

DESCRIPTION:  This format exports data for use with LOTUS 1-2-3 spreadsheets.
              Non-numeric fields will be in quotes. Each field will be
              separated by a space.

USAGE NOTE:  To import into 1-2-3, choose FILE->IMPORT->NUMBERS.

    OTHER NAME:  LOTUS 123 (NUMBERS)

        DESCRIPTION:

NAME: EXCEL-COMMA

DESCRIPTION:  Use this format to export data to the EXCEL spreadsheet on the
              Macintosh. The exported data will have a comma between each
              field's value. The user will be asked to specify the data type
              of each exported field. Those fields that are not numeric will
              be surrounded by quotes ("). Commas are allowed in the
              non-numeric data, but quotes (") are not.

USAGE NOTE:

    OTHER NAME:  COMMA DELIMITED

        DESCRIPTION:  Exported data is delimited by commas. Non-numeric data
              is surrounded by quotes.

    OTHER NAME:  CSV

        DESCRIPTION:  Comma Separated Values.
```

Figure 26: Listing FOREIGN FORMAT File Entries Using the Print Format Documentation Option

Define Foreign File Format Option

```

VA FileMan ... [DIUSER]
  Other Options ... [DIOther]
    Data Export to Foreign Format ... [DDXP EXPORT MENU]
      Define Foreign File Format [DDXP DEFINE FORMAT]
        **> Locked with DDXP-DEFINE

```

Figure 27: Define Foreign File Format Option

All exports depend on a Foreign Format. In addition, you can use Foreign Formats for imports as well. Usually, you will be able to use an existing format to properly format your data for export or import.

To find out what formats exist on your system, see the Print Format Documentation section. If no existing format meets your needs, use the Define Foreign File Format option to create a new one. You can use the Define Foreign File Format option to:

- Define a new Foreign Format from scratch.
- Modify a Foreign Format that has *not* been used to create an EXPORT template.
- Copy an existing format in order to create a similar, modified one.

If you are using the Export Tool through Kernel's menu system, you need the DDXP-DEFINE key to use the Define Foreign File Format option.

The following is an example of making a new format from an existing one:

The Define Foreign File Format option is the first one on the Data Export to Foreign Format submenu:

```

Select OPTION: OTHER OPTIONS
Select OTHER OPTION: DATA EXPORT TO FOREIGN FORMAT

Select DATA EXPORT TO FOREIGN FORMAT OPTION: DEFINE FOREIGN FILE FORMAT

```

Figure 28: Choosing the Define Foreign Format Option

You are first asked for the name of a format. If you want to create a new format from scratch, enter a new name. You will be presented with the ScreenMan form used to define a Foreign Format (see below).

Whenever you are asked to choose a FOREIGN FORMAT, you can reply with either the format's NAME or one of its OTHER NAMES.

Here, an existing format's name is given:

```
Select FOREIGN FORMAT: 123 IMPORT NUMBERS

123 IMPORT NUMBERS foreign format has been used to create an Export Template.
Therefore, its definition cannot be changed.
```

Figure 29: Selecting an Existing FOREIGN FORMAT File Entry

This format has already been used to create an EXPORT template. Since that template relies on the information in the FOREIGN FORMAT file's entry at the time the template was created, you *cannot* modify this format. Instead, you are given the option of seeing what is in the format:

```
Do you want to see the contents of 123 IMPORT NUMBERS format? NO// YES

NAME: 123 IMPORT NUMBERS           FIELD DELIMITER: 032
  MAXIMUM OUTPUT LENGTH: 0         FORMAT USED?: YES
  QUOTE NON-NUMERIC FIELDS?: YES   PROMPT FOR DATA TYPE?: YES
  SEND LAST FIELD DELIMITER?: YES  SUBSTITUTE FOR NULL: 0
DESCRIPTION: This format exports data for use with LOTUS 1-2-3
spreadsheets. Non-numeric fields will be in quotes. Each field
will be separated by a space. A 0 will be exported for null-
valued numeric fields in the primary file.
USAGE NOTES: To import into 1-2-3, choose FILE->IMPORT->NUMBERS.
```

Figure 30: Viewing the Contents of a FOREIGN FORMAT File Entry

As this example shows, the FORMAT USED? field is YES. This indicates that the format has been used to create an EXPORT template.

Whether you ask to see the contents of the format or not, you are next given the chance to make a copy of the format in order to modify it. You enter a name for the new format that does not yet exist in the FOREIGN FORMAT file:

```

Do you want to use 123 IMPORT NUMBERS as the basis
for a new format? NO// YES <RET> (Yes)

Name for new FOREIGN FORMAT: CLONE 123 IMPORT NUMBERS

Are you adding 'CLONE 123 IMPORT NUMBERS' as
a new FOREIGN FORMAT (the 22ND)? No// Y <RET> (Yes)
    
```

Figure 31: Creating a New FOREIGN FORMAT File Entry

When the new format has been created, you are given the opportunity to modify it. The ScreenMan form that follows is used for editing Foreign Formats:

```

                FOREIGN FILE FORMAT: CLONE 123 IMPORT NUMBERS                PAGE 1
                =====
FIELD DELIMITER: 032                                RECORD LENGTH FIXED?
SEND LAST DELIMITER? YES                            MAXIMUM OUTPUT LENGTH: 0
RECORD DELIMITER:                                  NEED FOREIGN FIELD NAMES?

FILE HEADER:
FILE TRAILER:
DATE FORMAT:

SUBSTITUTE FOR NULL: 0
QUOTE NON-NUMERIC? YES
PROMPT FOR DATA TYPE? YES

                Go to next page to document format.

                Press <PF1>H for help                INSERT
    
```

Figure 32: ScreenMan Form for Editing Foreign Formats

The meaning of the fields on this page of the form is described in the FOREIGN FORMAT File Attributes Reference section. You are presented with the same form whether you are modifying an existing format or creating one from scratch.

Here's a tip—It is important to always create and edit formats using the Data Export options because validity checks on the relationships between the various fields are built into the ScreenMan form. If you enter inconsistent data, you will be alerted when you try to exit the form.

There is a second page of the form that contains documenting information about the format. The second page allows you to enter a description and usage notes for the format. You can also enter other names for the format (in a Multiple); these other names can then be used to reference the format anywhere in the Export or Import Tools.

Here is what the second page looks like with the Multiple's "pop-up" window opened:

```

FOREIGN FILE FORMAT:  CLONE 123 IMPORT NUMBERS          PAGE 2
=====
DESCRIPTION (WP):
USAGE NOTES (WP):

Select OTHER NAME FOR FORMAT:  LOTUS 123 (NUMBERS)

  OTHER NAME:  LOTUS 123 (NUMB
  DESCRIPTION (WP):

Press <PFl>H for help          INSERT
    
```

Figure 33: Second Page of a Multiple's with a "Pop-up" Window Opened

After you have completed and filed the ScreenMan forms, you are returned to the Data Export submenu. You can now use the new format to create an EXPORT template or do an import.

2. Relational Navigation

Relational navigation gives you a way to reach beyond the current file to reference fields within other files.

Suppose, for example, you are doing a printout from the PATIENT file. In the PATIENT file, there is a pointer to the DOCTOR file. This links a given patient to a given doctor. But the only information about the doctor available from the point of view of the PATIENT file is the doctor's name. What if, in your printout, you want to print the doctor's name, phone number, and specialty (where phone number and specialty are fields in the DOCTOR file)?

The answer is to use relational navigation. By using the pointer relationship between the PATIENT and the DOCTOR file, you can start from the PATIENT file, and for each record in the PATIENT file, retrieve not only the name of the doctor for that patient, but also additional information about the doctor from the DOCTOR file.

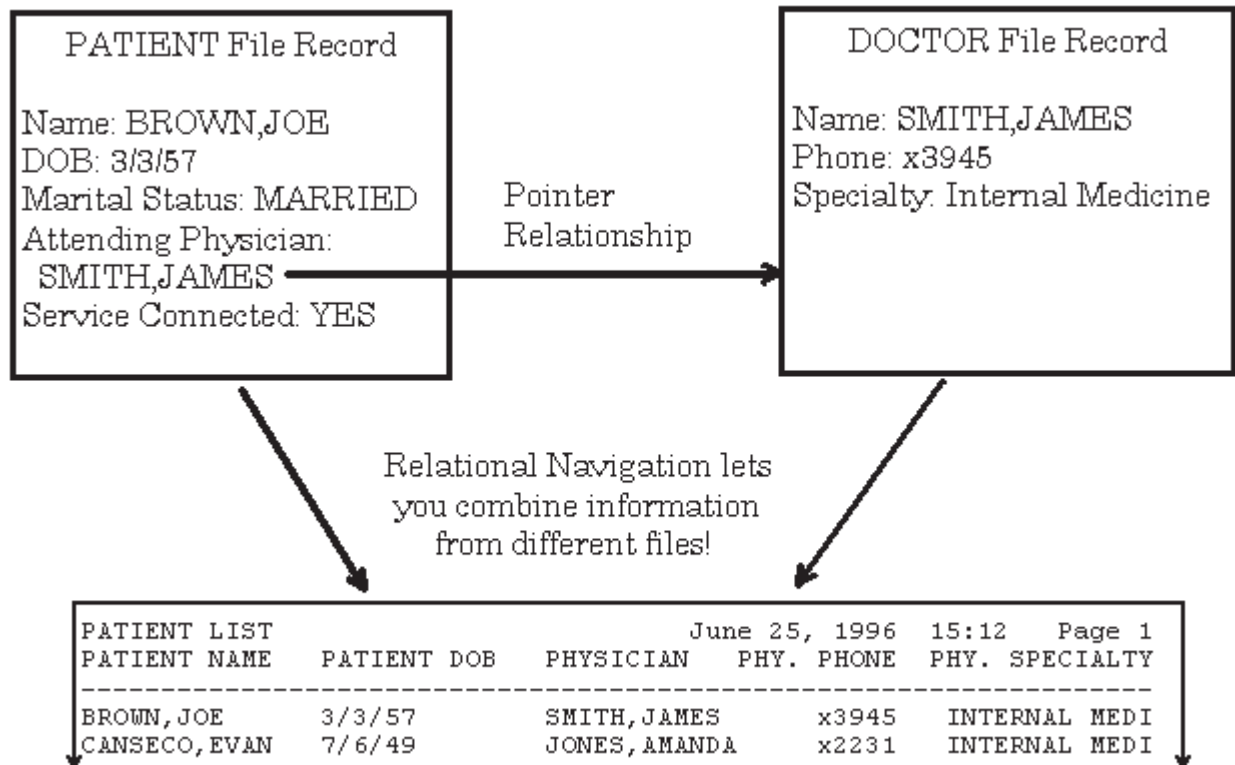

Figure 34: An Example Illustrating Relational Navigation

You can use relational navigation in many places in VA FileMan to *move beyond the current file* and retrieve or edit information in related files' records, including:

- Reports (Print Fields, Sort Criteria, Search Criteria)
- Editing Records (edit information in related files, not just current file)
- Computed Expressions
- COMPUTED Fields
- Within word processing | **Windows** |

The syntax to perform relational navigation, called Extended Pointer syntax, is discussed throughout this chapter.

Several types of pointer relationships between files can be exploited to combine information:

- Simple Extended Pointer (most common)
- Backward Extended Pointer
- Join Extended Pointer

A special form of relational navigation, called relational jumping, uses these pointer relationships to let you "jump" from one file to another. This makes it easier to specify a group of fields from another file when specifying what fields to edit, search, print, or sort by in interactive VA FileMan.

Simple Extended Pointer

The most common form of relational navigation uses *simple extended pointers*. This type of navigation requires a pointer field to exist from the current file to another file. Using a pointer field from an entry in the current file, you can easily retrieve information from the pointed-to entry in another file.

For example, suppose you are printing a report from the PATIENT file. Further suppose that the PATIENT file has a pointer field called ATTENDING PHYSICIAN field to the DOCTOR file. Now, what if you wanted to include the phone number of the attending physician for each patient in your report from the PATIENT file? The attending physician's phone number is stored in the DOCTOR file, not the PATIENT file.

You can include the attending physician's phone number for each patient in your report, by using a simple extended pointer at the "PRINT FIELD:" prompt:

```
PRINT FIELD: ATTENDING PHYSICIAN:PHONE NUMBER
```

Figure 35: An Example of a Simple Extended Pointer

You can use simple extended pointers in many places in VA FileMan, including:

- Reports (Print Fields, Sort Criteria, Search Criteria)
- Editing Records (edit information in related files, not just current file)
- Computed Expressions
- COMPUTED Fields
- Within word processing | **Windows** |

The syntax for simple extended pointers is described below.

Simple Extended Pointer Syntax (Short form)

With simple extended pointers, there must be an existing relationship based on a pointer field from the current file to the file you are interested in. In this case, you can reference a field in a pointed-to entry by using the following syntax:

```
pfield:element
```

"**Pfield**" is the name (or number, preceded by #) of a pointer field in the current file, and "element" is an element that exists in the field to which pfield points. This is called the short form of extended pointer syntax.

For example, since ATTENDING PHYSICIAN is a pointer field in the current file to the DOCTOR file, the short form of extended pointer syntax to reference the PHONE NUMBER field in the DOCTOR file would be:

```
ATTENDING PHYSICIAN:PHONE NUMBER
```

Simple Extended Pointer Syntax (Long Form)

The most complete or general form of extended pointer syntax (also called long form) is shown below:

```
expr:file:element
```

OR

```
expr IN file FILE:element
```

"**Expr**" is any expression that applies to the file that is your current context. "**File**" is the name of any file. "**Element**" is any element (field) in the file named by "file".

For example, since ATTENDING PHYSICIAN is a pointer field in the current file to the DOCTOR file, the long form of extended pointer syntax to reference the PHONE NUMBER field in the DOCTOR file would be:

```
ATTENDING PHYSICIAN:DOCTOR:PHONE NUMBER
```

OR

```
ATTENDING PHYSICIAN IN file DOCTOR:PHONE NUMBER
```

Examples

Relational Query Example

You can use simple extended pointers to make relational queries. For example, suppose you want to print all patients who are older than their attending physicians. A field in the PATIENT file called ATTENDING PHYSICIAN points to the DOCTOR file. Given a field PT AGE in the PATIENT file and a field DR AGE in the DOCTOR file, you can use the Print File Entries option and then enter the information that follows:

```
OUTPUT FROM WHAT FILE:  PATIENT
SORT BY:  NAME//  PT AGE>(ATTENDING PHYSICIAN:DR AGE)
WITHIN PT AGE>(ATTENDING PHYSICIAN:DR AGE) , SORT BY: <RET>

FIRST PRINT FIELD:  NAME
```

Figure 36: An Example of a Relational Query

Here, the simple extended pointer (ATTENDING PHYSICIAN:DR AGE) is used to make a comparison between values in fields in two different files.

COMPUTED Field Example

Suppose the PATIENT file has an ATTENDING PHYSICIAN field that points to the DOCTOR file. The DOCTOR file, in turn, has a field called SPECIALTY. If you want to create a COMPUTED field within the PATIENT file data dictionary that is equivalent to the SPECIALTY field in the DOCTOR file, you can define a COMPUTED field as:

```
'COMPUTED-FIELD' EXPRESSION:  ATTENDING PHYSICIAN:SPECIALTY
```

Figure 37: An Example of the Short Form Extended Pointer Syntax

The file does not have to be specified in this case since there is a direct link between the two files through the pointer field. This is an example of the *short form* of the simple extended pointer syntax.

An equivalent computed expression, which explicitly identifies the file is: ATTENDING PHYSICIAN IN DOCTOR FILE:SPECIALTY. This is the *long form* of the syntax. It is "long" because the file name is included.

How to Navigate With a Variable Pointer Field

If the pointing field is a variable pointer, the long form of the extended pointer syntax must be used so that VA FileMan will know which of the pointed-to files to search. Here is the syntax:

```
vpfield IN file FILE:element
```

OR

```
vpfield:file:element
```

"**Vpfield**" is the variable-pointer field in the current file, "**file**" is one of the possible pointed-to files, and "**element**" applies to that pointed-to file.

The following is an example from the PATIENT file where the PROVIDER field is a variable pointer to either the PHYSICIAN file or the PERSON file, and PHONE is a field in the PERSON file. You could enter the following print specifications:

```
FIRST PRINT FIELD: NAME
THEN PRINT FIELD: PROVIDER
THEN PRINT FIELD: FILE (PROVIDER)
THEN PRINT FIELD: PROVIDER:PERSON:PHONE
THEN PRINT FIELD: <RET>
```

Figure 38: Entering Print Specifications and Including Fields in Pointed-to Files

You would receive the following output:

NAME	PROVIDER	FILE (PROVIDER)	PROVIDER:PERSON:PHONE
BROWN, JOHN L.	CRUSHER, BEVERLY	PHYSICIAN	
GREEN, RICHARD	MCCOY, LEONARD M.	PERSON	223-3332

Figure 39: An Example of Output that Includes Fields from Pointed-to Files

The long form simple pointer asked for the PHONE field from the PERSON file. Only the variable pointer from the GREEN,RICHARD entry pointed to the PERSON file. Thus, only his phone number is displayed.

Relational Jumps Across Files

In interactive VA FileMan mode, you can use the following syntax:

```
file:
```

Doing this changes your context to the file you specify; you "jump" to the specified file. You can then select fields from the file to which you have jumped. You can only do this in four places in VA FileMan:

- "EDIT WHICH FIELD:" prompt (Enter or Edit File Entries option)
- "SEARCH FOR FIELD:" prompt (Search File Entries option)
- "SORT BY:" prompt (Print File Entries and Search File Entries option)
- "PRINT FIELD:" prompt (Print File Entries and Search File Entries option)

Relational jumping is mainly a convenience to make it easier to select more than one field from another file—by letting you temporarily "jump" to the other file, it's easier to pick all the fields you want directly, rather than having to use extended pointer syntax to specify each field.

When sorting, printing, searching, or editing, if you want to reference several fields from another file, it is more efficient to jump to the file and specify the needed fields than it is to use the extended pointer syntax to reference the fields one at a time. Multiple uses of the extended pointer cause multiple relational jumps.

There are three types of relational jumps that correspond to the three extended pointer syntax:

Type	Example
Simple (short form)	ATTENDING PHYSICIAN:
Simple (long form)	PROVIDER IN PERSON FILE:
Backward	RADIOLOGY EXAM:
Join	PAYSCALE IN FACTOR FILE:

Table 4: Relational Jumps that Correspond to Extended Pointer Syntax

Within the Enter or Edit File Entries option, for example, you can respond to the prompts as depicted in the dialogue that follows:

```

INPUT TO WHAT FILE: PATIENT
EDIT WHICH FIELD: ALL// NAME
THEN EDIT FIELD: ATTENDING PHYSICIAN: ← Relational Jump!
EDIT WHICH DOCTOR FIELD: ALL// NAME; "PHYSICIAN NAME"
THEN EDIT DOCTOR FIELD: NICKNAME
THEN EDIT DOCTOR FIELD: <RET>
THEN EDIT FIELD: <RET>
    
```

Figure 40: Using Relational Jumps with the Enter or Edit File Entries Option

Because of a pointer linkage between the ATTENDING PHYSICIAN field in the PATIENT file and the DOCTOR file, you can use the simple, short form of the extended pointer to navigate to the DOCTOR file. Then, during an interactive editing session you can specify the fields you want to edit for each patient. In this case, after you edit the patient’s name, you can edit that patient’s physician’s name and nickname.

Backward Extended Pointer

Simple extended pointers let you retrieve information from an entry in another file that the current entry explicitly points to through a POINTER TO A FILE field. What if you wanted to go the other way—retrieve information from an entry in another file that points to (*not* from) the current entry?

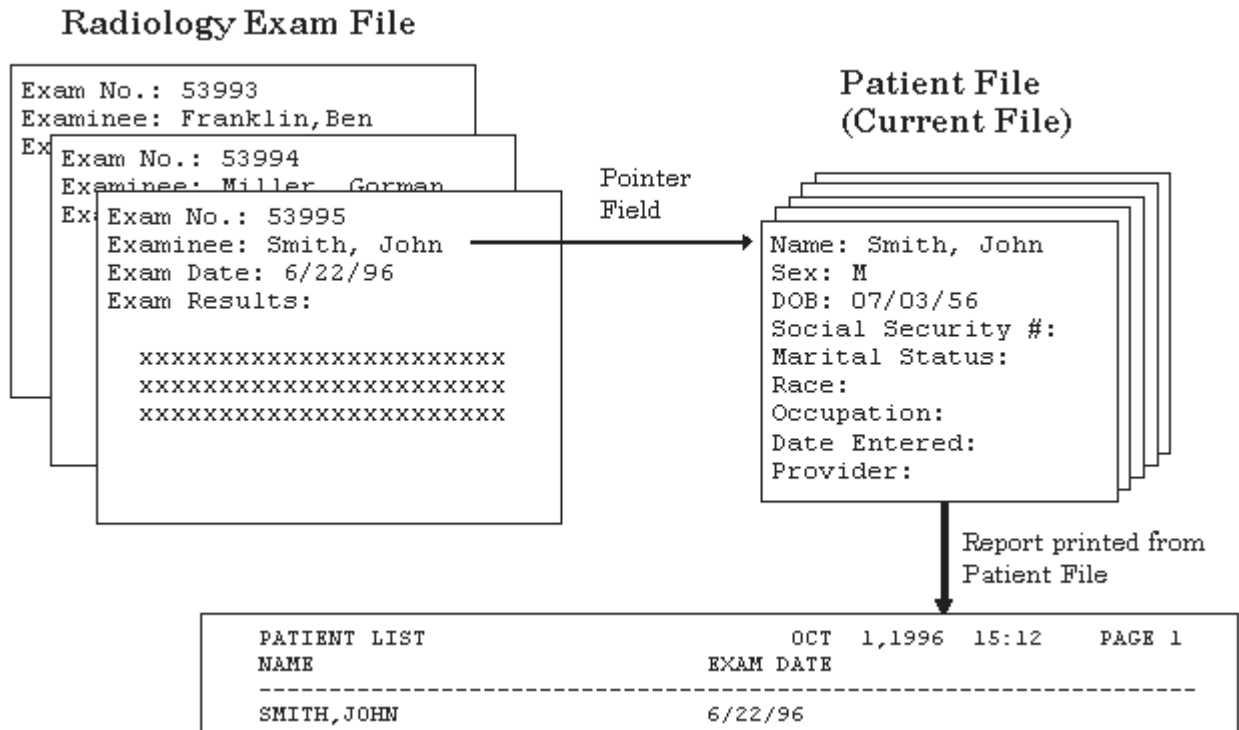

Figure 41: An Example Illustrating a File with Pointers to Another File

Suppose you've selected the PATIENT file and you want to list dates of radiology exams for certain patients. If the pointer is from the RADIOLOGY EXAM file to the PATIENT file (*not* the other way around), you can list the radiology exam dates using a *Backward Extended Pointer*.

The POINTER TO A FILE field to the current file from the pointing file *must be cross-referenced*. If the POINTER TO A FILE field is located in a Subfile, then the *whole* file must be cross-referenced by the pointer.

To use a Backward Extended Pointer, you must make a relational jump from the current file to the file in question (enter the name of the file pointing to the current file, followed by a colon). Once you make the relational jump to the backwards-pointer-linked file, specify which fields/elements to access in that file.

Relational Navigation

Returning to the situation mentioned above, within the RADIOLOGY EXAM file there is a field called EXAMINEE pointing back to our PATIENT file. That EXAMINEE pointer field is cross-referenced. You want to list the EXAM DATE field from the RADIOLOGY EXAM file entries that point back to a patient. From the PATIENT file, enter:

As indicated by this example, you did not have to specify the EXAMINEE field. That field was identified because it is a field in the RADIOLOGY EXAM file that points back to the current file.

The following is the output produced by these print specifications:

PATIENT LIST		OCT 1,1996 15:12	PAGE 1
NAME	EXAM DATE		
FRANKLIN, BEN	DEC 22,1995		
FRANKLIN, BENJAMIN, JR.			
MILLER, GORMAN	1995 1993		
SMITH, JOHN	SEP 29,1995 JUN 22,1996		

Figure 43: An Example of the Output Produced after Using a Backward Extended Pointer

The resulting output is a two-column report containing names from the PATIENT file and corresponding examination dates from the RADIOLOGY EXAM file. Since there may be several RADIOLOGY EXAM file entries for a given patient, this report is an example of a Multiple-valued (Multiline) result being returned.

For more information on Multiline results being returned, please refer to the "Multiline Return Values" topic that follows in this chapter.

You can use Backwards Extended Pointers in the following places in VA FileMan:

- "EDIT WHICH FIELD:" prompt (Enter or Edit File Entries option)
- "SEARCH FOR FIELD:" prompt (Search File Entries option)
- "SORT BY:" prompt (Print File Entries and Search File Entries option)
- "PRINT FIELD:" prompt (Print File Entries and Search File Entries option)

Relational Navigation

Join Extended Pointer

You can establish an extended pointer link even if there is no pre-existing pointer relationship between the two files. You use a value from one file to do a lookup in a second file.

Suppose you store in the PAY FACTOR file a list of factors for calculating taxes. Each entry in this file corresponds to a different pay scale. In the PERSONNEL file, you have a field called PAYSCALE. You want to retrieve the value of a field DEDUCTION in the PAY FACTOR entry that equals the PAYSCALE field for each entry in the PERSONNEL file. You can create a COMPUTED field expression in the PERSONNEL file:

```
'COMPUTED-FIELD' EXPRESSION: PAYSCALE IN PAY FACTOR FILE:DEDUCTION
```

Figure 44: Using a Value from One File to do a Lookup in a Second File

PAYSCALE was not defined as pointing to the PAY FACTOR file. The link to that file is made by the COMPUTED field definition. PAYSCALE could itself be a COMPUTED field. In this situation, the value of the PAYSCALE field in the PERSONNEL file is used to do a normal lookup in the PAY FACTOR file using all lookup type cross-references.

In database terminology, this extended pointer capability is similar to a **JOIN** operation because you can specify at any time a new relationship between two formerly unrelated files. Therefore, we call this type of pointing the Join Extended Pointer.

Limitations

If the join expression matches more than one entry in the file being joined, the first matching entry (by internal entry number) is returned as the result of the join. Thus, if your join expression is likely to match more than one entry, be aware that only the *first* matching entry is returned.

Example

You could find out if any entries in the PERSONNEL file could be matched against the NAME field in the PATIENT file just by specifying the following sort:

```
OUTPUT FROM WHAT FILE: PATIENT  
SORT BY: NAME IN PERSONNEL FILE
```

Figure 45: An Example of Matching Entries in Two Files Using the SORT BY Field

The expression at the "SORT BY:" prompt selects entries in the PERSONNEL file where the value of the NAME field in the PATIENT file matches the PERSONNEL file's .01 field. The PATIENT file's NAME field is being used as a lookup in the PERSONNEL file. Since we are evaluating the .01 field of the PERSONNEL file, the **":element"** part of the extended pointer syntax is unnecessary.

Multiline Return Values

When you use extended pointer syntax, a lookup is performed in the navigated-to file. This lookup usually evaluates to a single value. However, in some situations, extended pointer syntax can end up returning a Multiple-valued or "Multiline" result. Multiline responses can be generated by:

- Simple Pointer to a WORD-PROCESSING Field
- Simple Pointer to a Multiple
- Backward Pointer

You *cannot* use extended pointer syntax that can evaluate to a Multiline value at VA FileMan's "SORT BY:" and "SEARCH FOR FIELD:" prompts. Some of the ways in which you *can* use extended pointers that evaluate to a Multiline value are:

- As the definition of a COMPUTED field.
- Within word processing | **Windows** | (so one document can call another document to print inside it).
- For input to word processing data elements (so you can use the Enter or Edit File Entries option to stuff one document into another).
- As the name of a transfer document in the Line Editor's Transfer option.
- As a Print Field: specification in the Print File Entries option.
- In an INPUT template when a multi-valued field is being edited.

WORD-PROCESSING Field

WORD-PROCESSING field names (or field numbers preceded with a #) are allowed as elements in extended pointer expressions. For example, in the PATIENT file the HISTORY field is in the DIAGNOSIS Multiple. You can define this computed expression:

```
"B-12 Deficiency" IN DIAGNOSIS FILE:HISTORY
```

Figure 46: An Example of Using a WORD-PROCESSING Field in an Extended Pointer Expression

This Multiline computed expression would signify the WORD-PROCESSING HISTORY field text associated with a patient's B-12 Deficiency DIAGNOSIS. A

lookup is done on the DIAGNOSIS Multiple using "B-12 Deficiency" as the lookup value. If the patient does not have that DIAGNOSIS (or no HISTORY is associated with it), the value of this extended pointer expression would be null.

Multiples

You can use the simple pointer syntax to get data from Multiples of files pointed to by other files. The RADIOLOGY EXAM file described above points to the PATIENT file by way of the EXAMINEE field. In the PATIENT file there is a DIAGNOSIS Multiple. You could obtain a list of diagnoses associated with RADIOLOGY EXAM file entries by doing the following:

```
Select OPTION: PRINT FILE ENTRIES

OUTPUT FROM WHAT FILE: RADIOLOGY EXAM// <RET>
SORT BY: NAME// <RET>
START WITH NAME: FIRST// <RET>
FIRST PRINT FIELD: TEST NUMBER
THEN PRINT FIELD: EXAMINEE:DIAGNOSIS
THEN PRINT FIELD: <RET>
HEADING: RADIOLOGY EXAM LIST// <RET>
STORE PRINT LOGIC IN TEMPLATE: Exam Diagnoses
```

Figure 47: An Example of Using the Simple Pointer Syntax to Get Data from a Multiple

For each entry in the RADIOLOGY EXAM file, EXAMINEE points to an entry in the PATIENT file. The diagnoses associated with that patient are returned as the Multiline output of the expression EXAMINEE:DIAGNOSIS.

Backward Pointer

The following example shows how you can use the cross-referenced Backward Pointer that yields a Multiline response in an INPUT template:

```

INPUT TO WHAT FILE: PATIENT

EDIT WHICH FIELD: ALL// NAME
THEN EDIT FIELD: RADIOLOGY EXAM:
    By 'RADIOLOGY EXAM', do you mean the RADIOLOGY EXAM File,
    pointing via its 'EXAMINEE' Field? YES// <RET> (YES)

WILL TERMINAL USER BE ALLOWED TO SELECT PROPER ENTRY IN 'RADIOLOGY EXAM' FILE?
YES// <RET> (YES)
DO YOU WANT TO PERMIT ADDING A NEW 'RADIOLOGY EXAM' ENTRY? NO// <RET>
    EDIT WHICH RADIOLOGY EXAM FIELD: DATE OF EXAM
    THEN EDIT WHICH RADIOLOGY EXAM FIELD: RESULTS
    THEN EDIT WHICH RADIOLOGY EXAM FIELD: <RET>
THEN EDIT FIELD: ATTENDING PHYSICIAN
THEN EDIT FIELD: <RET>
STORE THESE FIELDS IN TEMPLATE: PATIENT-EXAM

```

Figure 48: An Example Using a Cross-referenced Backward Pointer to Yield a Multiline Response—Stored in an INPUT Template

To use this template you:

1. Specify the patient's name to edit.
2. Select one of the RADIOLOGY EXAM file's entries that point back to that patient.
3. Edit data within that selected entry in the RADIOLOGY EXAM file.
4. Return to edit another field in the PATIENT file.

A sample editing session using this INPUT template looks like this:

```
INPUT TO WHAT FILE: PATIENT
EDIT WHICH FIELD: ALL// [PATIENT-EXAM
Select PATIENT NAME: BROWN,JOE
NAME: BROWN,JOE// <RET>
Select RADIOLOGY EXAM: ?
CHOOSE FROM:
  1.   DEC 4, 1984
  2.   OCT 1, 1985
CHOOSE 1-2: 2
DATE OF EXAM: OCT 1, 1985// <RET>
RESULTS: NORMAL
ATTENDING PHYSICIAN: SMITH// <RET>
```

Figure 49: An Example Using an INPUT Template with a Cross-referenced Backward Pointer to Yield a Multiline Response

As indicated by this example, the only RADIOLOGY EXAM file entries you were allowed to choose were the two that pointed back to the selected patient (BROWN,JOE).

Each file, for the purpose of this editing sequence, is considered a subfile of the original, so that when no more fields within the second file are specified, the dialogue falls back to the original file. Having navigated over to a second file, you can use another extended pointer to move to still a third file.

You *cannot* cross file boundaries on input unless you have WRITE access to the file to which you move. This restriction applies to the individual who created this Patient-Exam INPUT template.

3. Advanced Edit Techniques

Field Value Stuffing

You can make the editing process quicker, easier, and more accurate by "stuffing" field values, when appropriate. The amount of data that needs to be entered from the keyboard can be reduced by providing responses that can be verified by pressing the Enter/Return key or that are automatically put into the file.

Set Field Default (2 //)

You can require a particular field to default to a certain data value by answering the "EDIT WHICH FIELD:" prompt with the name of the field followed with two slashes ("/") and the default value.

For example, if you enter:

```
EDIT WHICH FIELD: SEX//MALE
```

Figure 50: Setting a Default Value for a Field

In this example, every time you get to the SEX field prompt for an entry in which sex has not yet been recorded, MALE will be prompted as the default value of the SEX field.

Stuff/Delete Field Value (3///)

VA FileMan offers a way to force a value to be inserted into the database (i.e., "stuff"), even if a different value is already on file. You simply use three slashes ("///") instead of two:

```
EDIT WHICH FIELD: SEX///MALE
```

Figure 51: "Stuffing" a Value into a Field in the Database

No terminal dialogue occurs when such mandatory defaults are inserted.

If you want to force the value of SEX to be deleted, you would respond as follows:

```
EDIT WHICH FIELD: SEX///@
```

Figure 52: Deleting a Value from a Field in the Database

After entering the at-sign ("@"), you would see the following message:

```
WARNING: THIS MEANS AUTOMATIC DELETION!!
```

Figure 53: Warning Message when Deleting a Value from a Field in the Database

The three-slash default's value must contain the external value of the field. The value is validated (using the INPUT transform) just as a user-supplied response is validated.

Unvalidated Stuffs: (4///)

If you have programmer access, you can define a default that does not go through the INPUT transform by using four slashes ("/////"). If you use this kind of default, you must show the internally stored value of the field.

For example, since SEX is a SET OF CODES DATA TYPE where "m" stands for MALE, you could define a four-slash stuff like this:

```
EDIT WHICH FIELD: SEX/////m
```

Figure 54: "Stuffing" a Default Value into a Field in the Database—Bypassing the INPUT Transform

Variable Stuffs

An even more powerful kind of default is the variable default. In this mode, you specify, not a literal value like the word MALE, but rather a field name from which to calculate the default value for each entry being edited.

One example of the usefulness of this kind of default is a case where you are editing two fields that usually have the same value. Suppose that, for a set of patients, you

want to enter a NEXT OF KIN field, followed by a BENEFICIARY field. Once you have typed a patient's NEXT OF KIN, you want to see that particular answer as the default value of BENEFICIARY.

The process would look like this:

```

INPUT TO WHAT FILE: PATIENT
EDIT WHICH FIELD: ALL// NEXT OF KIN
THEN EDIT FIELD: BENEFICIARY//NEXT OF KIN
  DO YOU MEAN 'NEXT OF KIN' AS A VARIABLE? YES// <RET>
THEN EDIT FIELD: <RET>

Select PATIENT NAME: BROWN, JOE
NEXT OF KIN: MRS SARAH BROWN
BENEFICIARY: MRS SARAH BROWN// <RET>

Select PATIENT NAME: CAPLAN, IRVING
NEXT OF KIN: MR BILL CAPLAN
BENEFICIARY: MR BILL CAPLAN// MISS JULIE CAPLAN

```

Figure 55: An Example of "Stuffing" a Variable Default Value into a Field in the Database

Here, Mrs. Sarah Brown ends up as both the NEXT OF KIN and BENEFICIARY for Joe Brown, while Irving Caplan's NEXT OF KIN and BENEFICIARY are two distinct people.

A variable default value can be any computed expression—such as LAST VISIT DATE+365.

For more information on computed expressions, please refer to the "Computed Expressions" chapter in this manual.

WORD-PROCESSING Field Stuffing

The effect of stuffing values in a WORD-PROCESSING DATA TYPE field is similar to defaults for other fields: the default value becomes the first line of the WORD-PROCESSING text. Also, you can stuff many lines of text into a WORD-PROCESSING DATA TYPE by use of a computed expression that has a Multiline value (e.g., another WORD-PROCESSING-type field).

Alternatively, you can automatically append data to a WORD-PROCESSING DATA TYPE field by following the "/" or "/" with a "+" sign. This means add on the following text to whatever may already be on file. Let's take the example of our WORD-PROCESSING-type HISTORY field data in the PATIENT file:

```
EDIT WHICH FIELD: DIAGNOSIS
EDIT WHICH DIAGNOSIS SUB-FIELD: HISTORY//+ This case is essentially normal
```

Figure 56: Appending Text on to a WORD-PROCESSING Field Value

The text string following the "//+" is appended automatically to any HISTORY field text that already exists for the chosen patient and diagnosis. If no HISTORY field text existed, the string would become Line 1 of the HISTORY field text.

When editing the entry, you see the text with the addition and can edit it in the usual way. If you use three slashes ("///") instead of two, the addition is made, and you are not presented with the text to edit.

Looping (^LOOP)

The Enter or Edit File Entries option allows you to loop through a group of entries, without having to select each entry individually. After choosing the fields to edit, enter the entire word **^LOOP** in upper- or lowercase. Then, you can choose which entries to loop through by responding to the "EDIT ENTRIES BY:" and "START WITH ... GO TO" prompts. Answer these prompts in the same way that you respond to the "SORT BY:" and "START WITH ... GO TO" prompts in the Print File Entries option.

For more details, please refer to the "Specifying SORT BY Fields" topic in the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

In the example below, all entries would be looped through:

```

EDIT WHICH FIELD: NAME
THEN EDIT FIELD: DATE OF BIRTH
THEN EDIT FIELD: <RET>

Select PATIENT NAME: ^LOOP
  EDIT ENTRIES BY: NAME// <RET>
  START WITH NAME: FIRST// <RET>

  ADAMS,JOHN
NAME: ADAMS,JOHN// ADAMS,JACK
DATE OF BIRTH: APR 1, 1923// <RET>

  BROWN,JOE
NAME: BROWN,JOE// <RET>
DATE OF BIRTH: FEB 27, 1939// JAN 27, 1939
  :
```

Figure 57: An Example of "Looping" Through Entries in a File

You can enter a SORT template at the "EDIT ENTRIES BY:" prompt.

This **^LOOP** feature, in combination with the **///-stuff** convention, makes it easy to load data values into newly created fields.

Use caution with the automatic loading and automatic deleting features of VA FileMan, since these features loop through entries and make changes without stopping for verification.

For example, suppose we have a patient database to which a new field called FOLLOW-UP DATE has been added. We want to create values for this field for all patients who have LAST VISIT DATEs earlier than 1977 on file. For all such patients, we want FOLLOW-UP DATE set equal to JUNE 1, 1982. Use the Enter or Edit File Entries option as follows:

```

EDIT WHICH FIELD: FOLLOW-UP DATE///JUNE 1, 1982
THEN EDIT FIELD: <RET>

Select PATIENT NAME: ^LOOP

EDIT ENTRIES BY: NAME// LAST VISIT DATE
START WITH LAST VISIT DATE: FIRST// 1900
GO TO LAST VISIT DATE: LAST// DEC 31, 1976
    WITHIN LAST VISIT DATE, EDIT ENTRIES BY: <RET>

...HOLD ON, PLEASE...

    JONES, SAM
    SMITH, SALLY
    JOHNSON, BILL
    :
```

Figure 58: An Example of Loading Data into a Newly Created Field for Select Records

Now, without keyboard input, the system automatically loads the June 1, 1982 data value into each entry's new FOLLOW-UP DATE field while looping through LAST VISIT DATEs up to 1977.

Suppose you wanted to undo the work done in the previous example, that is, you want to delete all these FOLLOW-UP DATEs:

```

EDIT WHICH FIELD: FOLLOW-UP DATE/// @
WARNING-THIS MEANS AUTOMATIC DELETION!
THEN EDIT FIELD: <RET>

Select PATIENT NAME: ^LOOP
EDIT ENTRIES BY: NAME// LAST VISIT DATE
START WITH LAST VISIT DATE: FIRST// 1900
GO TO LAST VISIT DATE: LAST// 12 31 76
    WITHIN LAST VISIT DATE, EDIT ENTRIES BY: <RET>

...JUST A MOMENT, PLEASE...

    JONES, SAM
    SMITH, SALLY
    :
```

Figure 59: An Example of Deleting Data from a Newly Created Field for Select Records

INPUT Templates

Overview

Just as you can store complex output specification in a PRINT or a SORT template for later use, you can store a long list of edit fields in an INPUT template. If you answer the "EDIT WHICH FIELD:" prompt at least five different times, or if you answer it with a right bracket ("]"), you will be prompted for a template name. The following is an example:

```
Select OPTION: ENTER OR EDIT FILE ENTRIES

INPUT TO WHAT FILE: PATIENT
EDIT WHICH FIELD: ALL// NAME
THEN EDIT FIELD: DATE OF BIRTH
THEN EDIT FIELD: ]
THEN EDIT FIELD: <RET>
STORE THESE FIELDS IN TEMPLATE: UPDATE
```

Figure 60: Storing a List of Edit Fields in an INPUT Template

UPDATE is the name of the template. You'll notice that brackets were not included.

When stored in a template, the input specifications can be easily recalled in the future without retyping them. The template name must be from 2 to 30 characters in length; do not begin the template name with a bracket. Any field numbers (with their defaults and other qualifications, if you have specified any) are stored. When you return to this option, you can edit the same fields again in the same way by answering the "EDIT WHICH FIELD:" prompt with the name of the template enclosed in brackets, (e.g., [UPDATE]).

When you return to use an INPUT template in this way, you will be asked if you wish to edit its field specifications. If you answer YES, you will first see the template name, which you can then edit. Entering an at-sign ("@") at the "NAME:" prompt will delete the entire INPUT template.

You can then edit the security codes for READ and WRITE access, and then the original answers to the "EDIT WHICH FIELD:" prompts.

If your previous answer is less than 20 characters, it is followed by two slashes ("/"), after which you can re-enter the line. Longer answers are followed by "Replace" and are edited with the "Replace...With" syntax. Deleting with the at-sign ("@") works in either case.

The "Replace...With" syntax is described in the "Longer Default Responses and the "Replace ... With" Editor" topic in the "VA FileMan Prompts" chapter of the *VA FileMan Getting Started Manual*.

To insert a new field ahead of the field being displayed, precede your line with an up-arrow ("^"). When you have finished, you can save your edited INPUT template under the same name (use <Spacebar><Return>) or a new one.

You can create a special INPUT template by entering the right bracket ("]") at the "EDIT WHICH FIELD: ALL//" prompt. This template will contain all the fields currently in the file and will update the template when new fields are added to the file.

```
EDIT WHICH FIELD: ALL// ]
EDIT WHICH FIELD: ALL// <RET>
STORE THESE FIELDS IN TEMPLATE: EVERY FIELD
```

Figure 61: Creating a Special INPUT Template

Branching Within INPUT Templates

Sometimes, you want to dynamically control editing based on the responses given for a particular entry or on other aspects of the editing session. By using a technique called branching, the designer of an INPUT template can make the presentation of certain fields conditional based on the values of other fields. You must have programmer access to set up branching. With programmer access, any executable M code can be put into an INPUT template.

You can branch either to a field prompt elsewhere in the template or to a predefined place holder. The place holder is identified by @n, where "n" is an integer (e.g., @1).

To branch within an INPUT template, you enter M code at one of the "EDIT FIELD:" prompts. You set the variable Y to the branch destination. Y can be given the value of a field label, a field number, or a place holder. If Y is set to zero and editing is being done at the top level of a file, the template is exited. If Y is set to zero and a Multiple is being edited, the Multiple is exited.

The variable X will contain the *updated, internal* value of the field edited at the previous prompt. Thus, you can check X to determine if you want to set Y to branch or not. For example, suppose you had a file called ADMISSIONS. Some of the fields are concerned only with the discharge of a patient. You want to branch around those fields, if the DATE OF DISCHARGE is empty in the database and no date is given in the current editing session. Your template could be defined like this:

```
Select OPTION: ENTER OR EDIT FILE ENTRIES

INPUT TO WHAT FILE: ADMISSIONS
EDIT WHICH FIELD: ALL// NAME
THEN EDIT FIELD: DIAGNOSIS
THEN EDIT FIELD: ADMITTING PHYSICIAN
THEN EDIT FIELD: DATE OF DISCHARGE
THEN EDIT FIELD: S:X="" Y="@1"
THEN EDIT FIELD: DISCHARGING PHYSICIAN
THEN EDIT FIELD: FOLLOW-UP DATE
THEN EDIT FIELD: @1
THEN EDIT FIELD: BILLING METHOD
THEN EDIT FIELD: <RET>
STORE THESE FIELDS IN TEMPLATE: EDIT ADMISSION
  Are you adding 'EDIT ADMISSION' as a new INPUT TEMPLATE? Y <RET> (YES)
```

Figure 62: Defining an INPUT Template to Branch to a Different Field Based on Another Field's Value (1)

This template will branch around the discharge related questions, if the DATE OF DISCHARGE is null.

If you wanted to further enhance the template to ask for MEDICARE NUMBER only if BILLING METHOD is "M" (for Medicare), you could change the template like this:

```

INPUT TO WHAT FILE: ADMISSIONS// <RET>
EDIT WHICH FIELD: ALL// [EDIT ADMISSION] <RET> (OCT 31, 1991@14:17)
    USER #2 FILE #16155
WANT TO EDIT 'EDIT ADMISSION' INPUT TEMPLATE? NO// Y <RET> (YES)
NAME: EDIT ADMISSION// <RET>
READ ACCESS: @// <RET>
WRITE ACCESS: @// <RET>
EDIT WHICH FIELD: .01// <RET> NAME
THEN EDIT FIELD: 1// <RET> DIAGNOSIS
THEN EDIT FIELD: 2// <RET> ADMITTING PHYSICIAN
THEN EDIT FIELD: 3// <RET> DATE OF DISCHARGE
THEN EDIT FIELD: S:X="" Y="@1"// <RET>
THEN EDIT FIELD: 4// <RET> DISCHARGING PHYSICIAN
THEN EDIT FIELD: 5// <RET> FOLLOW-UP DATE
THEN EDIT FIELD: @1// <RET>
THEN EDIT FIELD: 6// <RET> BILLING METHOD
THEN EDIT FIELD: 7// S:X="M" Y="MEDICARE NUMBER"
THEN EDIT FIELD: S Y=0
THEN EDIT FIELD: MEDICARE NUMBER
THEN EDIT FIELD: <RET>
STORE THESE FIELDS IN TEMPLATE: <Space><RET> EDIT ADMISSION
(OCT 31, 1991@14:17) USER #2 FILE #16155
EDIT ADMISSION TEMPLATE ALREADY EXISTS.... OK TO REPLACE? Y <RET> (YES)
    
```

Figure 63: Defining an INPUT Template to Branch to a Different Field Based on Another Field's Value (2)

After the BILLING METHOD field is edited, a test is made of its contents. It is a SET OF CODES DATA TYPE; thus, the test is for the letter "M" alone (the internal value of the field). If it is equal to "M", the template branches to the MEDICARE NUMBER field. If it is not equal to "M", the template proceeds to the next prompt where Y is set unconditionally to zero. The template is exited here so that the MEDICARE NUMBER prompt is not shown when it is not needed.

An editing session using this template to add a new admission might look like this:

```

Select ADMISSIONS NAME: KEETON,KAREN
Are you adding 'KEETON,KAREN' as a new ADMISSIONS (the 4TH)? No// Y <RET>
(Yes)
DIAGNOSIS: MEASLES
ADMITTING PHYSICIAN: MERCHANT,JEAN
DATE OF DISCHARGE: <RET>
BILLING METHOD: M <RET> MEDICARE
MEDICARE NUMBER: 3093-0393
    
```

Figure 64: An Example Verifying the Automatic Branching to Other Fields Based on a User's Entry (1)

The discharge related questions were skipped, and the "MEDICARE NUMBER:" prompt was given. A future editing of this record upon patient discharge could look like this:

```
Select ADMISSIONS NAME: KEETON, KAREN
      ...OK? YES// <RET> (YES)

NAME: KEETON, KAREN// ^DATE OF DISCHARGE
DATE OF DISCHARGE: 5/9/90 <RET> (MAY 09, 1990)
DISCHARGING PHYSICIAN: MERCHANT, JEAN
FOLLOW-UP DATE: 6/1/90 <RET> (JUN 01, 1990)
BILLING METHOD: MEDICARE// <RET>
MEDICARE NUMBER: 3093-0393// <RET>
```

Figure 65: An Example Verifying the Automatic Branching to Other Fields Based on a User's Entry (2)

There is a potential hazard in using branching. In this example, suppose the BILLING METHOD were changed to "P" (for private insurance). The simple branching logic used would not show you the MEDICARE NUMBER field to edit or delete. You must ensure that your template can handle this kind of situation. In this example, if you have programmer access to do so, you might add M code to delete the MEDICARE NUMBER, if BILLING METHOD were not equal to "M".

Edit Qualifiers

Edit Qualifiers and Customizing Data Editing

When creating an INPUT template, there are several ways you can control the editing session to display customized prompts, to enable the duplication of data by pressing the Spacebar and the Enter/Return keys (<**Space**><**RET**>), and to make a field required.

The following table summarizes the edit qualifiers you can use to accomplish these results. They are described in more detail in the next three sections. Enter these qualifiers in conjunction with fields at the "EDIT FIELD:" prompt.

Qualifier	Action
field;"xxx"	Replace the field's label with a literal string during an editing session (see "Forcing Special Prompts" below).
field;T	Replace a field's label with its title during an editing session (see "Forcing Special Prompts" below).
field;DUP	Save responses for later use with < Space >< RET > and allow their recall (see "Duplicating Input Values" below).
field;REQ	Require a response to a field that is usually not required (see "Forcing Required Input" below).

Table 5: Edit Qualifiers

You can combine specifiers as long as you separate them with semicolons (e.g., **DATE OF BIRTH;T;REQ**).

Forcing Special Prompts

Normally, the standard label or name of a field is used to ask the user for the input value of that field. You can customize the prompt for a field by answering the "EDIT WHICH FIELD:" prompt with the label, followed by a semi-colon (";") and the desired prompt in quotation marks. Thus:

```
EDIT WHICH FIELD: DATE OF BIRTH;"DOB"
```

Causes the DATE OF BIRTH field to be presented in the form:

```
DOB:
```

or in the form:

```
DOB: APR 1, 1923//
```

To use the field's title instead of its label as the input prompt, follow the field name (or number) with ;**T**. Thus, when editing the PATIENT file, you can enter:

```
EDIT WHICH FIELD: .01 <RET> NAME
THEN EDIT FIELD: SSN;T
THEN EDIT FIELD: <RET>
```

Figure 66: An Example Using the Title Edit Qualifier

If you enter these specifications *and* if this field's title is defined as "Social Security Number," the user will encounter the "Social Security Number:" prompt instead of the "SSN:" prompt.

Duplicating Input Values

Sometimes many entries will need the same data value input for a particular field. If you follow a field label with ;**DUP** when selecting the field for editing, VA FileMan will use the data value that was just input for the prior entry, if you enter a single space character (<**Spacebar**><**Return**>) at the field prompt. For example:

```
EDIT WHICH FIELD: SEX;DUP
```

Figure 67: An Example Using the Duplicate Edit Qualifier

If all entries have the same data value, you may instead want to use the ^**LOOP** facility described earlier in this chapter.

Forcing Required Input

When creating an INPUT template, VA FileMan allows you to designate fields as required. Designating a field as required means that the user must enter data in that field. To do this, follow the field name with **;REQ**. The required specification looks like this:

```
EDIT WHICH FIELD: NAME;REQ
```

Figure 68: An Example Using the Required Edit Qualifier

Adding **;REQ** does not permanently affect the definition of the field. It is only effective for the current input session or for the specific INPUT template. To permanently make a field mandatory, use the Modify File Attributes option.

Text Formatting in Word Processing Fields

Word Wrapping

Word wrapping is performed when a WORD-PROCESSING-type field is printed. Two functions occur as part of word wrapping during prints: lines are "filled" to the right margin and lines are "broken" only at word breaks.

If word wrap is on (a data dictionary setting for the WORD-PROCESSING-type field in question), you can *override* the word wrapping function and force a line to be printed as it appears in the editor by doing one of the following with the line:

- Starting the line with a space.
- Pressing the Tab key at the end of the line while using the Line Editor, or type |**Tab**| at the end of the line while using the Screen Editor.
- Turning wrap off by using the |**NOWRAP**| function described below.

Lines that contain only punctuation are always printed as is. Thus, if you put a single space on a line, the previous line will not be filled and the subsequent line will begin in column one.

The editor's line numbers are meaningful only when editing. Since word processing data is usually printed in a wraparound mode, what is internally line three might be printed as lines five and six.

Tabs

Tabs can be meaningful wherever they occur in a line.

If you insert a tab by typing the special Tab key on the keyboard (or <Ctrl-I> on terminals without a Tab key), a |**Tab**| will be inserted in the text instead. When editing, a tab is recognized as |**Tab**|, not as five blank spaces.

Formatting Text with Word Processing Windows (Frames) | |

Expressions framed by vertical bars (" | |") are known as word processing *windows* or *frames*, and are evaluated as computed expression at print-time and will be printed as evaluated. (MailMan does not typically evaluate expressions within vertical bars, neither does the Inquire to File Entries option or the CAPTIONED PRINT template.) For example, |**TODAY+1**| will print out tomorrow's date.

You can use word processing windows to insert one of the following into the text of a WORD-PROCESSING-type field when that WORD-PROCESSING-type field is printed:

- A Field Name.
- A Computed Expression.
- Text Formatting Expression

The "Computed Expressions" chapter contains details of how to compose and use computed expressions.

Text Formatting Expressions in Word Processing Windows

The following is the list of recognized special text formatting functions that you can use within word processing windows. Most of these functions can be used in other contexts—for example, at the "PRINT FIELD:" prompt.

Text Formatting Expression	Description
RIGHT-JUSTIFY	Causes the text that follows it to be padded with spaces between words, so the right margin is even.
DOUBLE-SPACE	Causes the text that follows it to be printed with blank lines inserted every other line.
SINGLE-SPACE	Turns off double-spacing for the text that follows it.
TOP	Causes a page break to occur at this point.
NOBLANKLINE	If nothing will be printed on the line, this causes the line to be suppressed so that a blank line is not output. It is useful if the line contains only a computed expression that might evaluate to null.
PAGEFEED (arg)	Causes page breaks to occur in the text that follows it, whenever fewer than arg number lines remain on the current page.
PAGESTART (arg)	Causes the text on the following pages to begin at line # arg of the page.
SETPAGE (arg)	Resets page numbering, so that the page number that follows it will be arg+1 .
BLANK (arg)	Causes arg number of blank lines to be inserted at this point in the text.

Table 6: Text Formatting Expressions in Word Processing Windows

Table 6 (continued):

Text Formatting Expression	Description
INDENT (arg)	Causes the text that follows it to be indented arg number of spaces from the left margin.
SETTAB (arg1,arg2,arg3..)	Sets tab positions for the text that follows it. In subsequent lines, the first TAB encountered will cause indentation to column position arg1 characters from the left margin. The second TAB encountered will cause indentation to column position arg2 , and so on. If any SETTAB arg is negative, the text following the corresponding TAB will be right justified so that the rightmost column of that text will fall in the column number that is the absolute value of the SETTAB arg . If a SETTAB arg is the literal "C" (i.e., SETTAB("C")), the text following the corresponding tab setting will be centered.
CENTER (arg)	Causes the arg to be centered.
TAB	Causes the text to start printing at predetermined indents. The default column settings are 5,10,15,20, ..., which can be reset with SETTAB . TAB at the end of a line causes that line to be printed as is (no word wrapping).

Table 6: Text Formatting Expressions in Word Processing Windows (continued)

Table 6 (continued):

Text Formatting Expression	Description
TAB n	Overrides any SETTAB specification for the text that follows it and causes tabbing to the n th column over from the left margin. Output is right justified on the n th column, if " n " is negative. For example, the text following TAB 12 will begin at column 12; the text following TAB "C" will be centered.
WIDTH (arg)	Specifies that the text that follows it will always be printed in a column arg characters wide. (Arg , in other words, is the difference between the left margin position and the right margin position, plus one.)  In the absence of a WIDTH specification, the output column width is determined by the user (or defaulted by the system) at print time.
NOWRAP	Causes the text that follows it to be printed line-for-line (without wraparound). This eliminates the need to end each line with a tab or start the line with a space to force the line to be printed as it stands.
WRAP	Causes the text that follows it to be printed in wraparound mode. This is the default setting.
UNDERLINE (arg)	Causes the arg to be underlined.
_	Starts underlining. Underlining continues until a second _ is encountered. This only works on printers that underline.

Table 6: Text Formatting Expressions in Word Processing Windows (continued)

For additional information about functions, please refer to the "Computed Expressions" chapter in this manual.

In order to print a "|" character, you must enter it as "| |". Likewise, to print "| |" enter "| | | |".

4. Computed Expressions

You can use computed expressions in several places within VA FileMan to obtain, manipulate, modify, and format data. Computed expressions consist of one or more elements linked together with operators. Most computed expressions return a value after performing the actions you have requested. The way this result is used or displayed depends on where you have used the computed expression.

Syntax

Elements of Computed Expressions

You can use any of the following elements in constructing a computed expression:

- A **field name within the current file** (e.g., RELIGION). The field name can be partially spelled (e.g., REL), if the partial spelling is unambiguous.
- A **field number**, preceded with # (e.g., #3).
- A **literal number**. When used as part of a computed expression, do *not* use quotes (e.g., AGE AT ONSET+20). However, you *must* use quotes if the number will stand alone as a constant (e.g., "3.14159265").
- A **literal text string**, in quotes (e.g., "HELLO").
- A validly formatted **date**, such as 20 JULY 1969, which is punctuated only by spaces.

- Dashes in a computed expression are interpreted as minus signs. For example, 7-20-1969 would indicate subtraction and be evaluated as -1982.
- The word **NUMBER** (or the name of the file followed by the word NUMBER, such as, PATIENT NUMBER). NUMBER will return the internal entry number of the entry in the file or subfile in question.
- The **name of a file followed by the name of a field in that file** (e.g., PATIENT NAME). Like PATIENT NUMBER, this syntax is helpful when it is unclear to which file or subfile an expression is referring. However, this syntax cannot obtain data from **another** file; NAME and PATIENT NAME will return the same data. To obtain data from another file, the extended pointer syntax must be used.
- A **VA FileMan function**—e.g., [TODAY or MONTH(DATE OF BIRTH)]. Functions are discussed in the Functions chapter.

- An **extended pointer reference** to fields in another file. Extended pointers and relational jumping are described in the Relational Navigation chapter.

Operators in Computed Expressions

Computed expressions can consist of a single element. However, often several elements are joined together using operators. Operators are characters that perform some action on elements.

- Unary Operators
- Binary Operators
- Boolean Operators
- Parentheses in Expressions
- Example of a Compound Expression

Unary Operators

The simplest operators are the unary operators. They force a numeric interpretation of the element that follows. They can also affect the sign of the resulting number. The unary operators are:

Operator	Description
+	Positive numeric interpretation (sign unchanged)
-	Negative numeric interpretation (sign changed)

Table 7: Unary Operators

Binary Operators

Another set of operators takes two elements, manipulates them, and returns a result. These are called binary operators. You can use the following binary operators in computed expressions:

Operator	Description
+	Addition
-	Subtraction
*	Multiplication
/	Division
\	Integer (truncated) division (e.g., $13 \setminus 2 = 6$)
_	Concatenation (e.g., "AB"_ "CDE" = ABCDE)

Table 8: Binary Operators

Boolean Operators

A third set of operators makes a comparison between two elements and returns a true or false value. These are known as Boolean operators. If the outcome of a Boolean operation is true, the value one (1) is returned; if false, zero (0) is returned. You can use these Boolean operators in computed expressions:

Operator	Description
>	Greater than
<	Less than
=	Equal to
]	Follows (in alphabetical order)
[Contains (e.g., "AB"["A" is true; "A"["AB" is false)
!	Or, either element is true [e.g., (2=3)!(5<10) is true]
&	And, both elements are true [e.g., (2=3)&(5<10) is false]

Table 9: Boolean Operators

An apostrophe (') means negation or NOT. It can precede any of the Boolean operators. Thus, **6'>8** is read six is not greater than eight, which is true (a one is returned).

Parentheses in Expressions

In the absence of parentheses, the expression is evaluated strictly left to right. One operator is not given precedence over another. Use parentheses to control the order in which the operations of a computed expression are performed. Expressions within parentheses are evaluated first. Thus **3+4/2** is 3.5, whereas **3+(4/2)** is 5.

You can also use parentheses to ensure that the enclosed material is treated as an expression when there might be some ambiguity. For example, suppose you want to force a numeric interpretation of the SSN field. You need to use the + unary operator. However, the following will not yield the desired result:

```
SORT BY: +SSN
```

Is the + the unary operator or the sort specifier (meaning that you want to subtotal results by SSN)? In this case, it will be interpreted as the sort specifier. However, if you put the expression in parentheses, the + will definitely be interpreted as an operator:

```
SORT BY: (+SSN)
```

Example of Compound Expression

An example of a computed expression containing several elements and operators is:

```
"Beds occupied: "_(NUMBER OF BEDS*OCCUPANCY PERCENTAGE/100)
```

First, the part within the parentheses is evaluated. NUMBER OF BEDS and OCCUPANCY PERCENTAGE are field names. Their contents are multiplied and the result is divided by 100. That result is concatenated with the literal string "Beds occupied: " giving a result like:

```
Beds occupied: 484
```

DATA TYPEs in Computed Expressions

When you are working with file data in computed expressions, you must consider the appropriateness of the DATA TYPE of the field for the operation or function you are using. Here are some notes regarding DATA TYPEs and computed expressions:

- SET OF CODES, POINTER TO A FILE, and VARIABLE-POINTER DATA TYPEs
- DATE/TIME DATA TYPE
- WORD-PROCESSING DATA-TYPE

SET OF CODES, POINTER TO A FILE, and VARIABLE-POINTER DATA TYPES

These DATA TYPES are manipulated using the external representations, *not* the internal ones. (The internal value can be accessed using the INTERNAL function.)

DATE/TIME DATA TYPE

The DATE/TIME DATA TYPE usually yields results based on the internal value of the field when used in a computed expression. For example, the computed expression "DATE OF BIRTH: "_DOB, where DOB is a field with a DATE/TIME DATA TYPE, yields "DATE OF BIRTH: 2910713", where 2910713 is the internal representation of the date.

Often, you do not want the internal representation of the date to be used for output. There are alternatives. Continuing with concatenation as an example, you can concatenate a caption with the output of a function (e.g., "DATE OF BIRTH: "_NUMDATE(DOB) yields "DATE OF BIRTH: 07/13/91"). When using the Print File Entries option, you can separately identify the caption like this:

```
FIRST PRINT FIELD: "DATE OF BIRTH: "  
THEN PRINT FIELD: DOB;X
```

Figure 69: An Example Using the Print File Entries Option to Identify a Caption

Since DOB was not entered as part of a computed expression, it will produce output in VA FileMan's external date format: "DATE OF BIRTH: JUL 13, 1991".

You can perform certain arithmetic operations with DATE/TIME DATA TYPES that directly yield useful results:

- If you subtract a DATE/TIME DATA TYPE from another DATE/TIME DATA TYPE, the result is the number of days the two differ.
- If you add a number to or subtract a number from a DATE/TIME-valued field, the result is a new date. For example, if the DOB field has the value JUL 20, 1969, then the value of the computed expression DOB+30 is AUG 19, 1969.

WORD-PROCESSING DATA TYPE

WORD-PROCESSING DATA TYPE fields can be manipulated only with the contains ("[") operator (e.g., a valid computed expression within the DIAGNOSIS Multiple of our sample PATIENT file is: HISTORY["poverty"]). This Boolean expression is true, if the DIAGNOSIS in question has HISTORY text that contains the string "poverty".

Also, you *cannot concatenate* WORD-PROCESSING-type fields with other values using the concatenation ("_") operator.

Using Functions as Elements in Computed Expressions

You can use recognized functions as an element in any COMPUTED field expression. A function performs an operation that returns a value. These functions are available to all users. Functions can also be added by making entries in the FUNCTION file (#.5). If you examine this file, you will know all of the functions available to you.

The *VA FileMan Programmer Manual* describes how to add functions in the "VA FileMan Functions (Creating)" chapter.

Some functions require an argument or arguments; others are "argumentless." The arguments of the function can be any element, including field name, field number (preceded with the #), quoted literal, or even other functions. The SQUAREROOT function, for example, would take an argument of 64 and return 8. Thus, if the AGE field of a patient has the value 64, the expression SQUAREROOT(AGE) would equal 8.

You can find the syntax and description of the functions exported with VA FileMan in the "VA FileMan Functions" chapter in this manual.

Computed Expressions

Where to Use

Using Computed Expressions in COMPUTED Fields

One important place where you can use a computed expression is in a field that is computed. The COMPUTED field DATA TYPE allows a computed expression to be stored in the data dictionary.

To define a field as COMPUTED, use the Modify File Attributes option and reply to the "DATA TYPE:" prompt with "computed."

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USER THE SCREEN-MODE VERSION? Yes// NO <RET> (No)

MODIFY WHAT FILE: PATIENT

Select FIELD: AGE
Are you adding 'AGE' as a new FIELD (the 13TH)? Y <RET> (YES)
FIELD NUMBER: 13// <RET>

DATA TYPE OF AGE: COMPUTED
```

Figure 70: Defining a Field as a COMPUTED DATA TYPE

You now enter the computed expression that will be stored in the AGE field. In this case, a function (TODAY), a field name (DATE OF BIRTH), and a numeric literal are combined with two arithmetic binary operators to give a numeric result.

```
'COMPUTED-FIELD' EXPRESSION: TODAY-DATE OF BIRTH\365.25

TRANSLATES TO THE FOLLOWING CODE:
S Y(16033,13,1)=$S($D(^DIZ(16033,D0,0)):^(0),1:""),X=DT S
X=X,X1=X,X2=$P(Y(16033,13,1),U,3),X="" D:X2 ^%DTC:X1 S X=X\365.25
```

Figure 71: Entering the Computed Expression into a COMPUTED Field

You will only see the generated code if you have programmer access.

When creating a COMPUTED field that might have a numeric result, the following dialogue is presented:

```
NUMBER OF FRACTIONAL DIGITS TO OUTPUT (ONLY ANSWER IF NUMBER-VALUED) : 0
```

Figure 72: An Example of Dialogue Encountered with a COMPUTED Field with an Expected Numeric Result (1)

Pressing the Enter/Return key at this prompt means that the field is not numeric; it will be left justified on output. If you do answer, you indicate that the field is numeric and that you want the computed value rounded to a certain number of decimal places when it is printed. In this case, the number will be rounded to a whole number.

```
SHOULD VALUE ALWAYS BE INTERNALLY ROUNDED TO 0 DECIMAL PLACES?  
No// <RET> (No)
```

Figure 73: An Example of Dialogue Encountered with a COMPUTED Field with an Expected Numeric Result (2)

Since the value of a COMPUTED field can be used in other calculations, you need to indicate when rounding should occur. If you accept the default (i.e., "No"), rounding will *not* be done when the COMPUTED field is used in other calculations. A YES answer to this prompt means that you do want the rounded value used in calculations. Usually, you do not want values rounded at interim steps in a series of calculations. Thus, usually, you will accept the "No" default.

When a COMPUTED field is printed, the value will always be rounded to the number of decimal places you specify.

```
WHEN TOTTALLING THIS FIELD, SHOULD THE SUM BE COMPUTED FROM THE SUMS  
OF THE COMPONENT FIELDS? No// <RET> (No)
```

Figure 74: An Example of Dialogue Encountered with a COMPUTED Field with an Expected Numeric Result (3)

If your computed expression involves division or multiplication, you will be asked how the field should be totaled. (You can total the values of a field in the Print File Entries option.) A NO answer to this prompt means that the COMPUTED field's expression will be evaluated for each entry and those results will be added. A YES

answer means that values of each of the fields in the COMPUTED field's expression will be added first and then the COMPUTED field's expression will be applied to those totals.

For example, suppose **A** and **B** are the names of two fields and **A/B** is a computed expression. The table below shows the results of printing **A**, **B**, and **A/B** with different answers to the "WHEN TOTALLING THIS FIELD, ..." question:

	A	B	A/B (YES: Total from totals of component fields)	A/B (NO: Total from results for each entry)
	10	5	2	2
	100	50	2	2
	2	1	2	2
Total	112	56	[112/56=] 2	[2+2+2=] 6

Table 10: An Example Indicating Possible Results of a Computed Expression Based on Different Entries to the "Totaling" Prompt

To summarize, if you want your total to be the ratio or product of the total of the component fields, then answer this question YES. Otherwise, a NO answer is appropriate.

The answer to this prompt only affects the Total produced by the Print File Entries option.

When defining a COMPUTED field, you will also be asked:

LENGTH OF FIELD: 8// <RET>

Figure 75: Dialogue Encountered When Defining a COMPUTED Field

Here you can enter the maximum number of character positions that the field should occupy in output. The default value is eight, even if the COMPUTED field involves FREE TEXT-type fields. Be sure to allocate enough space to accommodate the results. If the COMPUTED field's value is numeric, the entire result is displayed regardless of the requested length.

The COMPUTED-type field can be a very useful tool. Having set up such a field, you can then search or sort by it, and also include it in the definition of other COMPUTED-type fields. In the latter case, independence is preserved. Thus, for example, if you define COMPUTED Field #2 in terms of COMPUTED Field #1 and then decide to redefine Field #1, Field #2 will automatically use the new Field #1 calculation. If you try to delete a field that is referenced by a COMPUTED-type field, you will be warned.

Where to Use Computed Expressions "On the Fly"

"On the Fly" Computed Expressions

In addition to permanently storing a computed expression in a data dictionary, there are several places within VA FileMan's dialogue where you can use a computed expression **"on the fly"**:

- "PRINT FIELD:" Prompt
- "SEARCH FOR FIELD:" Prompt
- "SORT BY:" Prompt
- Field Value Stuffing
- OUTPUT Transforms
- Word Processing Windows (| |)

"PRINT FIELD:" PROMPT

Whenever, you are within the Print or Search File Entries options, you are asked:

FIRST PRINT FIELD:

OR

THEN PRINT FIELD:

You can answer with a computed expression. For example:

```
FIRST PRINT FIELD: SEX_ " _RELIGION;" ;L33
```

Figure 76: Entering a Computed Expression at a PRINT FIELD Prompt

This computed expression will return the contents of the SEX and RELIGION fields separated by a space. Notice that you can follow the computed expression with print qualifiers: ";" to suppress the column heading and ;L33 to indicate that the COMPUTED field length can be 33 characters long.

A user with programmer access can also enter M code at this prompt. The M code must have a WRITE statement for anything that is to be written to the report.

"SEARCH FOR FIELD:" PROMPT

In the Search File Entries option, you can answer the

```
SEARCH FOR FIELD:
```

prompt with a computed expression.

If the expression is Boolean (i.e., its value is either true or false), you won't be asked the condition of the search, because the computed expression itself specifies that condition.

A user with programmer access can also enter M code at this prompt. The M code must set the variable X to whatever is to be compared against the search value.

"SORT BY:" PROMPT

In Print or Search File Entries options, you can answer the

```
SORT BY:
```

prompt with a computed expression. If you use a Boolean computed expression, you won't be asked for the "START WITH" parameters.

A user with programmer access can also enter M code at this prompt. The M code must set the variable X to the sort value.

Thus, if you want to print a list of the names of all patients who are Baptists, you could enter:

```
Select OPTION: PRINT FILE ENTRIES  
  
OUTPUT FROM WHAT FILE: PATIENT  
SORT BY: RELIGION="BAPTIST"  
    WITHIN RELIGION="BAPTIST", SORT BY: <RET>  
FIRST PRINT FIELD: NAME
```

Figure 77: Entering a Computed Expression at a SORT BY Prompt

This is a common way to select certain records for printing.

FIELD VALUE STUFFING

In the Enter or Edit File Entries option, you can follow the // or /// specifiers with computed expressions. The expression is evaluated for the entry you are inputting and used as a variable stuff value.

Suppose you want to put the current contents of a patient's NEXT OF KIN field into the BENEFICIARY field, with a notation that this value is UNVERIFIED, for all patients who don't have a value in the BENEFICIARY field. The dialogue would look like this:

```
Select OPTION: ENTER OR EDIT FILE ENTRIES  
INPUT TO WHAT FILE: PATIENT  
EDIT WHICH FIELD: BENEFICIARY///NEXT OF KIN_ " (UNVERIFIED) "  
THEN EDIT FIELD: <RET>  
  
Select PATIENT NAME: ^LOOP  
    EDIT ENTRIES BY: BENEFICIARY=""  
    WITHIN BENEFICIARY="", EDIT ENTRIES BY: <RET>
```

Figure 78: "Stuffing" a Value in a Field via a Computed Expression

This example uses two "on the fly" expressions: one in answer to the "EDIT ENTRIES BY:" prompt (which is essentially a SORT BY for looping) and one as the forced default value for the BENEFICIARY input field.

BENEFICIARY="" is a Boolean (true-false) computed expression that means "The BENEFICIARY value equals null."

After the previous dialogue, the names of such patients would be printed out, and their BENEFICIARY value would automatically be set equal to their NEXT OF KIN field value, concatenated with a space followed by "(UNVERIFIED)."

OUTPUT TRANSFORMS

OUTPUT transforms change the way a field is displayed when printed. Frequently, the OUTPUT transform will contain a computed expression that alters the data stored internally in the field. A simple OUTPUT transform that converts the internally stored date into MM/DD/YY format is:

```
DATE OF BIRTH OUTPUT TRANSFORM: NUMDATE (DATE OF BIRTH)
```

Figure 79: Entering a Computed Expression in an OUTPUT Transform

If an OUTPUT transform is applied to a field, the result of the transform will be used if that field is used in another computed expression. For example, if DATE OF BIRTH is used in a PRINT template, the "transformed" value will be output:

```
THEN PRINT FIELD: NAME_'S BIRTHDAY: "_DATE OF BIRTH
```

Figure 80: Entering a Computed Expression in an OUTPUT Transform Attached to a Field

The result of this computed expression would be similar to:

```
JOHN DOE'S BIRTHDAY: 03/07/42
```

Figure 81: An Example of the Result of an OUTPUT Transform with a Computed Expression

WORD PROCESSING WINDOWS (| |)

When entering text into a field with a WORD-PROCESSING DATA TYPE, you can insert a computed expression within a | **Window** |. This expression will be evaluated at the time the WORD-PROCESSING-type field is printed. If the expression is meaningful, its value will replace the | **Window** | in the printed output.

Computed Expressions

For example, you could embed within the text of the HISTORY WORD-PROCESSING-type field a **|Window|** containing a COMPUTED field expression:

```
HISTORY:  
1> PATIENT IS A |SEX_" "_RELIGION| WHO HAS NO  
2> APPARENT PROBLEMS.
```

Figure 82: A |Window| with a Computed Expression

When this field is printed for a patient who has a SEX value of MALE and a RELIGION value of CATHOLIC, the output would look like:

```
PATIENT IS A MALE CATHOLIC WHO HAS NO  
APPARENT PROBLEMS.
```

Figure 83: An Example of the Result of a |Window| with a Computed Expression

5. VA FileMan Functions

How to Use VA FileMan Functions

This chapter lists each VA FileMan Function, including syntax and simple examples of their use. You can use them in any computed expression.

For more information on computed expressions, please refer to the "Computed Expressions" chapter in this manual.

A function performs an operation that returns a value. Many functions are included with VA FileMan; you can also add functions by making entries in the FUNCTION file (#.5).

The VA FileMan Programmer Manual describes how to add functions, in the "VA FileMan Functions (Creating)" section.

Some functions require an argument or arguments; others are "argumentless." The arguments of the function can be any element, including field name, field number (preceded with the #), quoted literal, or even other functions. The SQUAREROOT function, for example, would take an argument of 64 and return 8. Thus, if the AGE field of a patient has the value 64, the expression SQUAREROOT(AGE) would return 8.

If there is an output transform on a field, the function code is applied to the field after it has been transformed. In most cases, if a field has an output transform, you should therefore use the syntax `FUNCTION_NAME(INTERNAL(FIELD_NAME))`, rather than `FUNCTION_NAME(FIELD_NAME)`.

Documentation Conventions for VA FileMan Functions

While studying this chapter's functions, syntax, and examples, you will encounter the following conventions:

Convention	Description
"	In the format arguments: Indicates mandatory quotation marks.  If you enter a literal string as an argument, quotation marks are also necessary.
=>	In examples: Indicates the output of the function.
[]	In examples: Indicates information about the outcome of the function.
boldface type	Indicates specific reference to an argument.

Table 11: Documentation Conventions for VA FileMan Functions

FUNCTION(argument, . . .) is the general format. You must enter the function's name in uppercase; the case of the arguments depends on the circumstances. Arguments are always surrounded by parentheses.

VA FileMan Functions

The following table lists the VA FileMan functions by category.

For a description of each function, please refer to the "VA FileMan Functions" chapter in the **HTML version** of the *VA FileMan Advanced Programmer Manual* located on the VA FileMan Home Page at:

<http://www.vista.med.va.gov/softserv/infrastr.uct/fileman/>

Category	Function
Date/Time	DATE DAYOFWEEK MID MINUTES MONTH MONTHNAME NOON NOW NUMDATE NUMDATE4 NUMDAY NUMMONTH NUMYEAR NUMYEAR4 RANGEDATE TIME TODAY YEAR
Environmental	BREAKABLE CLOSE SITENUMBER USER

Table 12: VA FileMan Functions (by Category)

Table 12 (continued):

Category	Function
File and File Data	COUNT FILE INTERNAL LAST MAXIMUM MINIMUM nTH NEXT PREVIOUS SETDATA TOTAL
Mathematical	ABS BETWEEN MAX MIN MODULO SQUAREROOT
Printing Related Functions	IOM PAGE
String	DUP LOWERCASE PADRIGHT REPLACE REVERSE STRIPBLANKS TRANSLATE UPPERCASE

M-Related Functions	\$A[SCII] \$C[HAR] \$E[XTRACT] \$F[IND] \$H[OROLOG] \$I[O] \$J[OB] \$J[USTIFY] \$L[ENGTH] \$P[IECE] \$R[ANDOM] \$S[ELECT] \$S[TORAGE] \$X \$Y

Table 12: VA FileMan Functions (by Category, continued)

Date/Time Functions

DATE

Format:	DATE(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This date function returns the date portion of a date/time expression.
Example:	DATE(NOW) => AUG 21,1991

For tips on displaying date-valued elements such as this function in computed expressions (e.g., printing), please refer to the "Data Types in Computed Expressions" topic in the "Computed Expressions" chapter in this manual.

DAYOFWEEK

Format:	DAYOFWEEK(datexp)
Parameters:	datexp is an expression with date/time value.
Use:	This function returns the day of the week of the date in datexp .
Example:	DAYOFWEEK(DATE OF BIRTH) => TUESDAY

MID

Format:	MID
Parameters:	(none)
Use:	This argumentless function returns the current date with a 24:00 time stamp. It represents tonight at midnight.
Example:	MID => AUG 23,1991 24:00

For tips on displaying date-valued elements such as this function in computed expressions (e.g., printing), please refer to the "Data Types in Computed Expressions" topic in the "Computed Expressions" chapter in this manual.

MINUTES

Format:	MINUTES(datexp1,datexp2)
Parameters:	datexp1 and datexp2 are date/time expressions. Time stamps are not necessary.
Use:	This function returns the number of minutes that datexp1 is after datexp2 . If no time is associated with a date/time expression, DATE@12:00 A.M. is used.
Examples:	MINUTES(MID,NOW) => 832 MINUTES(MID,TODAY) => 1440

MONTH

Format:	MONTH(datexp)
Parameters:	datexp is a date/time expression.
Use:	This function returns the month and year from a date/time valued expression.
Example:	MONTH(DATE OF BIRTH) => AUG 1943

MONTHNAME

Format:	MONTHNAME(n)
Parameters:	n is an expression that evaluates to an integer from 1 through 12.
Use:	This function returns the full name of the month corresponding to n .
Examples:	<p>MONTHNAME(4) => APRIL</p> <p>MONTHNAME(+SE(DATE OF BIRTH,4,5)) => APRIL [Function SE extracts the 4th and 5th digits from a date stored in FileMan internal format: YYYYMMDD.]</p>

NOON

Format:	NOON
Parameters:	(none)
Use:	This argumentless function returns today's date with a time stamp of 12:00.
Example:	NOON => AUG 23,1991 12:00

For tips on displaying date-valued elements such as this function in computed expressions (e.g., printing), please refer to the "Data Types in Computed Expressions" topic in the "Computed Expressions" chapter in this manual.

NOW

Format:	NOW
Parameters:	(none)
Use:	This argumentless function returns the current date and time.
Example:	NOW => AUG 23,1991 11:23

For tips on displaying date-valued elements such as this function in computed expressions (e.g., printing), please refer to the "Data Types in Computed Expressions" topic in the "Computed Expressions" chapter in this manual.

NUMDATE

Format:	NUMDATE(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the date in datexp in MM/DD/YY format.
Example:	NUMDATE(DATE OF BIRTH) => 03/07/49

NUMDATE4

Format:	NUMDATE4(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the date in datexp in MM/DD/YYYY format.
Example:	NUMDATE4(DATE OF BIRTH) => 03/07/1949

NUMDAY

Format:	NUMDAY(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the day of the month in datexp as a number.
Example:	NUMDAY(DATE OF BIRTH) => 7 [DATE OF BIRTH = March 7, 1949]

NUMMONTH

Format:	NUMMONTH(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the month in datexp as a number.
Example:	NUMMONTH(DATE OF BIRTH) => 3 [DATE OF BIRTH = March 7, 1949]

NUMYEAR

Format:	NUMYEAR(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the last two digits of the year in datexp as a number.
Example:	NUMYEAR(DATE OF BIRTH) => 49 [DATE OF BIRTH = March 7, 1949]

NUMYEAR4

Format:	NUMYEAR4(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the four digit year in datexp as a number.
Example:	NUMYEAR4(DATE OF BIRTH) => 1949 [DATE OF BIRTH = March 7, 1949]

RANGEDATE

Format:	RANGEDATE(datexp1,datexp2,datexp3,datexp4)
Parameters:	<p>datexp1 is a date valued expression beginning the first range of dates.</p> <p>datexp2 is a date valued expression ending the first range of dates.</p> <p>datexp3 is a date valued expression beginning the second range of dates.</p> <p>datexp4 is a date valued expression ending the second range of dates.</p>
Use:	This function returns the number of days that the two ranges of dates overlap.
Example:	RANGEDATE(DATE OF BIRTH,NOW,20 JUL 1981,20 JUL 1982) => 366

TIME

Format:	TIME(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns time from datexp in 12 hour format with AM/PM.
Example:	TIME(NOW) => 1:15 PM

TODAY

Format:	TODAY
Parameters:	(none)
Use:	This argumentless function returns today's date.
Example:	TODAY => AUG 26,1991

For tips on displaying date-valued elements such as this function in computed expressions (e.g., printing), please refer to the "Data Types in Computed Expressions" topic in the "Computed Expressions" chapter in this manual.

YEAR

Format:	YEAR(datexp)
Parameters:	datexp is an expression with a date/time value.
Use:	This function returns the year from datexp .
Example:	YEAR(DATE OF BIRTH) => 1949

Environmental Functions

BREAKABLE

Format:	BREAKABLE(n)
Parameters:	n is a number or numeric expression with a value of 1 or 0.
Use:	This function returns nothing. When used within a PRINT template, this function determines whether or not <Ctrl-C> can be used to break out of a report print. If n = 1, <Ctrl-C> will break out; if n = 0, it will not. Under default conditions, <Ctrl-C> will break you out. The value of n is returned.
Example:	BREAKABLE(0) =>0; [<Ctrl-C> is disabled]

CLOSE

Format:	CLOSE(device)
Parameters:	device is an open device, in the form of a valid argument for an M Close command.
Use:	This function should only be used within VA FileMan code when Kernel is unavailable. It closes the specified device.

SITENUMBER

Format:	SITENUMBER
Parameters:	(none)
Use:	This argumentless function returns your site's identifying number that was entered during VA FileMan initialization and stored in ^DD("SITE",1). (Do <i>not</i> use this function to retrieve a VA Institution Station Number.)
Example:	SITENUMBER => 99

USER

Format:	USER("attribute")
Parameters:	<p>attribute is one of these codes:</p> <p># user's DUZ value (the user's number)</p> <p>N user's name</p> <p>I user's initials</p> <p>T user's title</p> <p>NN user's nickname</p> <p> These codes must be surrounded by quotes within the function.</p>
Use:	<p>This function returns information about the currently logged on user. The information comes from the NEW PERSON file (#200).</p> <p> This function will not work if you are using VA FileMan without a NEW PERSON file in ^VA(200,.</p>
Example:	USER("#") => 160

File and File Data Functions

COUNT

Format:	COUNT(fname) COUNT(fname:field)
Parameters:	In the first format, fname is the name of a file or of a Multiple in your current file. In the second format: fname is the name of your current file or Multiple. field is the name of a field (or a field number preceded by #) in fname .
Use:	This function counts the number of entries in a file or in a Multiple. You can count the lines in a word processing field by using the first format with the word processing field name as the fname . If the second format is used, the number of entries with non-null values in field is returned.
Examples:	COUNT(PATIENT) -> 1349 [the number of entries in the PATIENT file] COUNT(PATIENT:PROVIDER) => 1288 [number of patients with providers recorded]

FILE

Format:	FILE(vpointer)
Parameters:	vpointer is the label or field number of a variable pointer field.
Use:	This function returns the name of the file to which a variable pointer points for a particular entry.
Example:	FILE(PROVIDER) => STAFF PROVIDERS

INTERNAL

Format:	INTERNAL(field)
Parameters:	field is the label of a field or a field number preceded by #.
Use:	This function returns the internally stored value of the field for a particular entry. It is useful in obtaining the internally stored (instead of displayed) value of a POINTER TO A FILE, VARIABLE-POINTER, DATE/TIME, or SET OF CODES DATA TYPE.
Examples:	INTERNAL(PROVIDER) => 136;VA(200, INTERNAL(SEX) => m

LAST

Format:	LAST(fname) LAST(fname:field)
Parameters:	In the first format, fname is the name of a file or of a Multiple-valued field in your current file. In the second format: fname is the name of your current file or Multiple. field is the name of a field (or a field number preceded by #) in fname .
Use:	This function returns the last entry in a file or in a Multiple identified by fname . If the second format is used, the last entry with a non-null value in field is returned. The last entry is the one with the highest internal entry number; the function does not analyze the values of the entries.
Examples:	LAST(DIAGNOSIS) => Sepsis [last entry in this Multiple field] LAST(DIAGNOSIS:OCCURRENCES) => 3

MAXIMUM

Format:	MAXIMUM(fname) MAXIMUM(fname:field)
Parameters:	<p>In the first format, fname is the name of a file or of a Multiple in your current file.</p> <p>In the second format:</p> <p>fname is the name of your current file or Multiple.</p> <p>field is the name of a field (or a field number preceded by #) in fname.</p>
Use:	<p>With the first format, this function returns the largest value from the .01 field of the file or Multiple identified by fname. The second format returns the largest value from field. The function works only if the internally stored values of the entries are numeric. Thus, you can use numeric or date valued fields. Also, free text fields will work if the stored values are numbers. Computed fields with numeric results can be used. Pointer fields will return the value from the pointed-to file.</p>
Examples:	<p>MAXIMUM(APPOINTMENT) => FEB 25,1991 [APPOINTMENT is a Multiple-valued DATE/TIME field]</p> <p>MAXIMUM(PATIENT:AGE) => 93 [AGE is a field in the current file, PATIENT]</p>

MINIMUM

Format:	MINIMUM(fname) MINIMUM(fname:field)
Parameters:	<p>In the first format, fname is the name of a file or of a Multiple-valued field in your current file.</p> <p>In the second format:</p> <p>fname is the name of your current file or Multiple.</p> <p>field is the name of a field (or a field number preceded by #) in fname.</p>
Use:	<p>This function returns the smallest value from the file's .01 field or from the Multiple identified by fname. The second format returns the smallest value from field. (See MAXIMUM for limits of use.)</p>
Examples:	<p>MINIMUM(APPOINTMENT) => MAR 1,1979 [APPOINTMENT is a Multiple-valued DATE/TIME field]</p> <p>MINIMUM(PATIENT:AGE) => 18</p>

nTH

Format:	<p>The syntax of this function is different because the function's name is defined by the user. The name is a number followed by an ordinal number suffix.</p> <p>nTH(fname)</p> <p>nTH(fname:field)</p>
Parameters:	<p>In the first format, fname is the name of a file or of a Multiple in your current file.</p> <p>In the second format:</p> <p>fname is the name of your current file or Multiple.</p> <p>field is the name of a field (or a field number preceded by #) in fname.</p>
Use:	<p>This function returns the nth entry in a file or in a Multiple identified by fname. If the second format is used, the value of the specified field associated with the nth entry in fname is returned. The nth entry is determined by the internal entry number; the function does not analyze the values of the entries. When used with the second format, the nth subentry with a non-null value is returned.</p>
Examples:	<p>2ND(DIAGNOSIS) => Angina Pectoris [the second entry in the DIAGNOSIS Multiple]</p> <p>10TH(ADMISSION:ADMISSION DATE) => JAN 2, 1990 [ADMISSION DATE associated with the tenth ADMISSION]</p>

NEXT

Format:	NEXT(field)
Parameters:	field is a field's number preceded by a # or a field's label from the current file or Multiple.
Use:	This function returns the value for the field identified by field in the next entry. The next entry is determined by internal entry number. No analysis of the value of entries is done. If there are no more entries, the function returns null.
Example:	NEXT(AGE AT ONSET) => 56 [the value of AGE AT ONSET for the next entry in the Subfile]

PREVIOUS

Format:	PREVIOUS(field)
Parameters:	field is a field's number preceded by a # or a field's label from the current file or Multiple.
Use:	This function returns the value for the field identified by field in the previous entry. The previous entry is determined by internal entry number. No analysis of the value of entries is done. If there is no prior entry, the function returns null.
Example:	PREVIOUS(AGE AT ONSET) => 29 [the value of AGE AT ONSET for the prior entry in the Subfile]

SETDATA

Format:	SETDATA(target,value)
Parameters:	target is a field to receive new data. value is an expression whose value will be inserted in the field.
Use:	The function produces no output. The value of the value expression is moved into the designated field in the permanent database. When using this function, you should be located at the same level in a file as the target field (that is, not in a different Multiple). By using the extended pointer syntax for target , value can be placed into another file.
Example:	SETDATA(DATE REPORT LAST RUN,TODAY) => [no output; field DATE REPORT LAST RUN will have a new value]

TOTAL

Format:	TOTAL(fname) TOTAL(fname:field)
Parameters:	In the first format, fname is the name of a file or of a Multiple-valued field in your current file. In the second format: fname is the name of your current file or Multiple. field is the name of a field (or a field number preceded by #) in fname .
Use:	With the first format, this function totals the values of the .01 field of a Multiple or file identified by fname . The second format totals the values in field . The field being totaled must have numeric values.
Example:	"\$_TOTAL(VISIT COST) => \$569.32 [VISIT COST is a Multiple]

Mathematical Functions

ABS

Format:	ABS(n)
Parameters:	n is a number or an expression with a numeric value.
Use:	This mathematical function will return the value of n without a sign; it gives the absolute value of n .
Example:	ABS(-23.87) => 23.87

BETWEEN

Format:	BETWEEN(n1,n2,n3)
Parameters:	<p>n1, n2, and n3 are numbers or numeric expressions:</p> <ul style="list-style-type: none"> • n1 is the number being tested. • n2 is one limit for the test. • n3 is the other limit for the test.
Use:	This Boolean function determines if n1 is within the limits defined by n2 and n3 . If n1 is within this range, a value of 1 (true) is returned; otherwise, 0 (false) is returned. If n1 equals n2 or n3 , 1 (true) is returned.
Examples:	<p>BETWEEN(OCCURRENCES,5,10) => 0 [OCCURRENCES is a field with value = 3]</p> <p>BETWEEN(-3,-10,0) => 1</p>

MAX

Format:	MAX(n1,n2)
Parameters:	n1 and n2 are numbers or numeric expressions.
Use:	This function returns the larger of n1 and n2 . Date/time field values can be used resulting in the most recent date/time being returned.
Examples:	MAX(54,23) => 54 MAX(DATE OF BIRTH,TODAY) => AUG 23,1991

MIN

Format:	MIN(n1,n2)
Parameters:	n1 and n2 are numbers or numeric expressions.
Use:	This function returns the smaller of n1 and n2 . Date/time field values can be used resulting in the earliest date/time being returned.
Examples:	MIN(54,23) =>23 MIN(DATE OF BIRTH,TODAY) => NOV 1,1938

MODULO

Format:	Format: MODULO(n1,n2)
Parameters:	<p>n1, n2 are numbers or numeric expressions.</p> <p>n1 is the dividend.</p> <p>n2 is the divisor.</p>
Use:	This mathematical function returns the remainder when n2 is divided into n1 ; it performs modulo division.
Example:	MODULO(54,5) => 4

SQUAREROOT

Format:	SQUAREROOT(n)
Parameters:	n is a numeric expression greater than 0.
Use:	This mathematical function returns the square root of n .
Example:	SQUAREROOT(9) => 3

Printing Related Functions

IOM

Format:	IOM
Parameters:	(none)
Use:	This argumentless function returns the number of columns for the present output device.
Example:	IOM/2 => 0

PAGE

Format:	PAGE
Parameters:	(none)
Use:	This argumentless function returns the current page number when output is being printed.
Example:	"Page " _PAGE => Page 23 [the 23rd page of output]

String Functions

DUP

Format:	DUP(string,n)
Parameters:	<p>string is any string of characters or an expression yielding a string of characters.</p> <p>n is a positive integer or a numeric expression.</p>
Use:	<p>This function returns a string of characters n characters long. If string is less than n characters long, the characters in string will be repeated until the output string is n characters in length.</p>
Example:	<p>DUP(DIAGNOSIS,3) => Ang [value of DIAGNOSIS = Angina Pectoris]</p> <p>DUP("_",IOM) => _____ [line drawn will have a length equal to the value of IOM]</p>

LOWERCASE

Format:	LOWERCASE(string)
Parameters:	string is an expression yielding alphabetic characters.
Use:	<p>This function will change uppercase characters in string to lowercase except for the first character and the first character after a punctuation. A space is a punctuation; thus, the first letter of a word will not be changed. String cannot be a word processing field; the contents of a word processing field will be unaffected.</p>
Example:	LOWERCASE("LEWIS,JERRY LEE") => Lewis,Jerry Lee

PADRIGHT

Format:	PADRIGHT(string,n)
Parameters:	string is a string or string expression to be printed. n is the total size of the output string.
Use:	This function will pad string on the right with spaces to make a string n characters long. If string is longer than n characters, the entire string will be returned; this function will not truncate.
Examples:	PADRIGHT("Peter",10) => Peter [five spaces after the 'r'] PADRIGHT(CITY,15) => San Juan Capistrano

REPLACE

Format:	REPLACE(string,oldstring,newstring)
Parameters:	string is the string expression that will be changed. oldstring is a string expression containing the character(s) in string that will be replaced. newstring is a string expression containing the character(s) that will replace those in oldstring .
Use:	This function returns the input string with all occurrences of the oldstring changed to the newstring . The oldstring and newstring can be any length. They do not have to be equal in length.
Examples:	REPLACE("abracadabra","ab","*") => *racad*ra REPLACE("Name is: XXX","XXX",NAME) => Name is: SMITH,AL

REVERSE

Format:	REVERSE(string)
Parameters:	string is a string expression.
Use:	This function returns the characters in string in reverse order.
Example:	REVERSE(NAME) => neB,nilknarF

STRIPBLANKS

Format:	STRIPBLANKS(string)
Parameters:	string is a string expression.
Use:	This function removes leading and trailing spaces from string .
Example:	STRIPBLANKS(" Waste no space ") => Waste no space [no leading or trailing spaces]

TRANSLATE

Format:	TRANSLATE(string,"oldchar","newchar")
Parameters:	string is a string expression to be changed. oldchar are the character(s) to be translated. newchar are the character(s) to replace the oldchar .
Use:	This function alters string by changing each character in oldchar into the character in the corresponding position in newchar . The translation is one character for one character.
Examples:	TRANSLATE("08261991","123","ABC") => 08B6A99A TRANSLATE(NAME,"J","j") => JOHNSON,jIM

UPPERCASE

Format:	UPPERCASE(string)
Parameters:	string is an expression with alphabetic characters.
Use:	This function will change lowercase characters in string to uppercase. String cannot be a word processing field; the contents of a word processing field will be unaffected.
Example:	UPPERCASE("vista") => VISTA

Temporary Data Storage Functions

PARAM

Format:	PARAM("parameter")
Parameters:	parameter has been assigned a value by the SETPARAM function.
Use:	This function works with the SETPARAM function. It returns the value that has been given to parameter by use of the SETPARAM function.
Example:	PARAM("AGE") => 45

SETPARAM

Format:	SETPARAM(value,"parameter")
Parameters:	value is an expression to be evaluated. parameter is a string 1 to 30 characters long identifying a storage location to hold value .
Use:	This function works with the PARAM function. It returns nothing. Value is stored in parameter for later reference.
Example:	SETPARAM(TODAY-DATE OF BIRTH\365,"AGE") => [no output; result of the expression put into "AGE"]

VAR

Format:	VAR("variable")
Parameters:	variable is a variable in the local symbol table.
Use:	This function returns the value of variable . The variable can be one that you set using the SET function.
Examples:	VAR("COUNT") => 1 [1 is the current value of COUNT] VAR("DUZ") => 160

SET

Format:	SET(value,"variable")
Parameters:	value is an expression to be evaluated. variable is a local variable name used to hold the value of value .
Use:	This function returns value's value. In addition, the value is placed in a local variable. Variable should be namespaced to avoid conflict with other local variables. You can use this function only if you have programmer's access.
Example:	SET(1,"COUNT") => 1 [this would put 1 into the variable COUNT]

M-Related Functions

\$A[SCII]

Format:	\$A(string,n)
Parameters:	<p>string is a string of characters or an expression yielding a string.</p> <p>n is an integer or expression yielding an integer.</p>
Use:	The function returns the numeric ASCII value of the character in position n within string . If n is not specified, the value of the first character is returned.
Examples:	<p>\$A(NAME,4) => 77 [NAME is SHAM,SAM THE]</p> <p>\$A("Get the value") => 71</p>

\$C[HAR]

Format:	\$C(n, . . .)
Parameters:	n is an integer or an expression yielding an integer.
Use:	This function returns the character corresponding to the ASCII value of n . If more than one n is specified in the argument, a string of characters will be returned.
Examples:	<p>\$C(100) => d</p> <p>\$C(99,100,101) => cde</p>

\$E[XTRACT]

Format:	<p>\$E(string,n1,n2)</p> <p>\$E(string,n)</p> <p>\$E(string)</p>
Parameters:	<p>string is a string expression.</p> <p>n, n1, and n2 are positive integers or expressions yielding positive integers.</p>
Use:	<p>This function returns a substring from string. If you use only string as a argument, the first character is returned. If you specify one n, the character in that position in the string is returned. If you specify n1 and n2, a string starting at n1 and ending at n2 is returned.</p>
Examples:	<p>\$E(NAME,3,7) => ith,A [NAME is Smith,A]</p> <p>\$E(NAME,2) => m</p> <p>\$E(NAME) => S</p>

\$F[IND]

Format:	\$F(string,target) \$F(string,target,n)
Parameters:	string is a string expression. target is the character(s) or an expression yielding the character(s) to be searched for. n is a positive integer or an expression yielding a positive integer.
Use:	This function returns the character position in string following the target . If n is specified as a third argument, the search for target is begun after character position n . If target is not found, 0 is returned.
Examples:	\$F("Smith,Al",",") => 7 \$F(NAME,",",7) => 0 [NAME has value of Smith,Al]

\$H[OROLOG]

Format:	\$H
Parameters:	(none)
Use:	This system variable returns the date and time in internal M format. The format is number of days since December 31, 1840, followed by a comma followed by the number of seconds since midnight.
Example:	\$H => 55032,48780

\$I[O]

Format:	\$I
Parameters:	(none)
Use:	This system variable returns the current device. It may return the operating system's designation of the current device.
Example:	\$I => _LTA9239

\$J[OB]

Format:	\$J
Parameters:	(none)
Use:	This system variable returns your current job number.
Example:	\$J => 543172581

\$J[JUSTIFY]

Format:	\$J(string,n) \$J(n1,n2,n3)
Parameters:	<p>In the first format, string is a string expression; n is an integer representing width of field.</p> <p>In the second format, n1 is a numeric expression; n2 is an integer representing the width of field; n3 is the number of decimal places to output with the number.</p>
Use:	<p>In the first format, the function returns string right justified within a field that has a width of n. If string is longer than n, there is no truncation.</p> <p>In the second format, the function returns n1 right justified in a field that has a width of n2. There will be n3 decimal places to the right of the decimal point.</p>
Example:	<p>\$J(NAME,20) =></p> <p style="padding-left: 40px;">Smith,Al</p> <p>[12 spaces preceding the 'S']</p> <p>"\$"_\$J(PRESCRIPTION COST,8,2) =></p> <p>\$ 25.88</p> <p>[3 spaces preceding the '2']</p>

\$L[LENGTH]

Format:	\$L(string) \$L(string,delimiter)
Parameters:	string is a string expression. delimiter is a character (or characters) or an expression yielding a character (or characters) that divides the string into pieces.
Use:	In the first format, the function returns the number of characters in string . In the second format, the function returns the number of pieces into which delimiter divides the string. If delimiter does not exist within string , 1 is returned.
Examples:	\$L(PROVIDER) => 11 [PROVIDER is Finch,Peter] \$L(PROVIDER,",") => 2 [same PROVIDER]

\$P[IECE]

Format:	<p>\$P(string,"delimiter",n)</p> <p>\$P(string,"delimiter",n1,n2)</p> <p>\$P(string,"delimiter")</p>
Parameters:	<p>string is a string expression.</p> <p>delimiter is a character (or characters) or an expression yielding a character (or characters) that divides the string into pieces.</p> <p>n, n1, and n2 are positive integers or expressions evaluating to positive integers.</p>
Use:	<p>The function returns a part of string. String is divided into substrings by delimiter. In the first format, the nth substring is returned. In the second format, the substrings starting with n1 and ending with n2 are returned. The delimiters between those substrings are also returned. In the third format, the first substring (i.e., the one preceding the first occurrence of delimiter) is returned.</p>
Examples:	<p>\$P("McMillan,John",",",2) => John</p> <p>\$P(PHONE,"-",2,3) => 943-2109</p> <p>\$P(PHONE,"-") => 510</p>

\$R[ANDOM]

Format:	\$R(n)
Parameters:	n is a positive integer or an expression evaluating to a positive integer.
Use:	This function returns a randomly generated integer from the range of 0 through n-1 .
Example:	\$R(5000) => 1076

\$S[ELECT]

Format:	\$S(test:value,test:value,...)
Parameters:	expression is an expression that can be evaluated as True or False (not zero or zero). value is any expression that can yield a value.
Use:	Each value is associated with the test from which it is separated by a colon. The function returns the evaluation of the value associated with the first test that evaluates as true (i.e., not equal to zero). Any number of test:value pairs can be used; however, one of the tests must evaluate as true. To assure that one test will always evaluate as true, the last test is usually the literal 1.
Examples:	\$S("Bill Nichols, Ph.D."["M.D.":"He is a medical doctor.",1:"He is not a medical doctor."] => He is not a medical doctor. \$S(OCCURRENCES>3:"Chronic Condition",OCCURRENCES>0: "Non Chronic Condition",1:"No Occurrences Recorded") => Chronic Condition [Here the contents of the OCCURRENCES field is being tested. If the first test (>3) is true (as in this example), the result of the second test (>0) is not relevant.]

\$\$[TORAGE]

Format:	\$\$
Parameters:	(none)
Use:	This system variable returns the number of bytes of free space available for use. Its meaning varies with the M implementation.
Example:	\$\$ => 52672

\$X

Format:	\$X
Parameters:	(none)
Use:	This system variable returns the current X coordinate (column) location of the cursor or print head. If the application that moved the cursor did not update the value of \$X, the value of \$X will not be reliable.
Example:	\$X => 43

\$Y

Format:	\$Y
Parameters:	(none)
Use:	This system variable returns the current Y coordinate (row) location of the cursor. Like \$X, its reliability depends on the controlling application.
Example:	\$Y => 6

6. Statistics

How to Generate Statistics from Reports

VA FileMan currently offers three types of statistical processing:

- Descriptive
- Scattergram
- Histogram

In each case, to generate statistics from reports, you use a two-step process:

1. Use the Print File Entries or Search File Entries options to generate a VA FileMan report. Do not queue the report. The entries you select in your report are the ones on which statistics will be generated; the way you use sort and print qualifiers in the report affects the way statistics will be generated, as discussed later in this chapter.
2. Immediately after the report finishes, use the Statistics option on the VA FileMan menu to generate statistics.

The two-step process for each type of statistical output is described below.

If you have statistical software on a personal computer, you might want to consider using VA FileMan's Export Tool as an alternative to VA FileMan's statistics options, especially if the statistics options described in this chapter do not provide the statistical analysis you need. With the Export Tool, you can export your data into a format your personal computer statistical software can read and use all of that software's capabilities to perform statistical analyses on VA FileMan data.

Statistics

Descriptive Statistics

The Descriptive Statistics routine creates a summary report of the numeric information produced by the preceding print. The number of cases is always shown.

To get descriptive statistics for fields printed out in a report, you must associate one of the following qualifiers with fields in the print:

Qualifier	Description
#	Count, mean, standard deviation, minimum, and maximum
+	Count and mean

Table 13: Descriptive Statistics Qualifiers

To obtain descriptive statistics:

1. Print a report, and use the # or + print qualifiers on one or more fields.
2. Immediately after the report completes, generate the Descriptive Statistics based on the report.

Initial Print

Figure 84: Initial Print Dialogue with Descriptive Statistics

Generating the Descriptive Statistics

```
Select OPTION: OTHER OPTIONS
Select OTHER OPTION: STATISTICS
Select STATISTICAL ROUTINE: DESCRIPTIVE STATISTICS
      User: WILLIAMS,BERNARD      2:51 PM 02/15/96

      DESCRIPTIVE STATISTICS
```

	N OF CASES	MEAN	STANDARD DEVIATION	MINIMUM	MAXIMUM
BUDGET	27	45845.1481	25685.8582	2589.0000	95200.0000
COST	27	45914.1111	25796.2936	259.0000	96000.0000

Figure 85: Generating the Descriptive Statistics

Scattergram

If you subtotal by two fields (i.e., sub-subtotal) in a sort, you can create Scattergrams for fields that were counted with !, +, or # in the corresponding print.

Only numeric values are charted. The Scattergram is scaled to fit your output device's row and column dimensions. Occurrences of more than nine points in a single print position are marked by an asterisk ("*").

Initial Print

```
Select OPTION: PRINT FILE ENTRIES

OUTPUT FROM WHAT FILE: BUDGET// <RET>
SORT BY: NAME// +REGION
START WITH REGION: FIRST// <RET>
  WITHIN REGION, SORT BY: +DISTRICT;S
  START WITH DISTRICT: FIRST// <RET>
FIRST PRINT FIELD: !REGION
THEN PRINT FIELD: !DISTRICT
THEN PRINT FIELD: <RET>

(output is generated here)
```

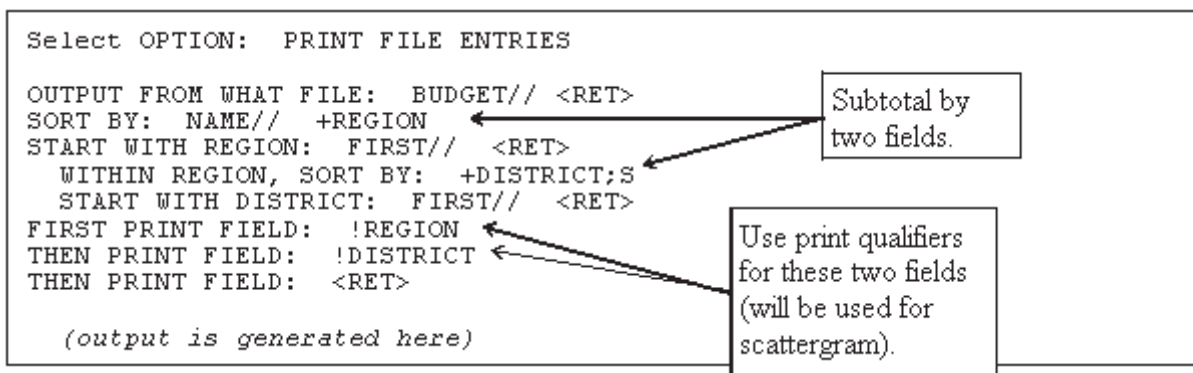

Figure 86: Initial Print Dialogue for a Scattergram

Generating the Scattergram

Select OPTION: **OTHER OPTIONS**
Select OTHER OPTION: **STATISTICS**
Select STATISTICAL ROUTINE: **SCATTERGRAM**

Figure 87: Generating the Scattergram

Histogram

If you subtotal by one or more fields in a sort, you can get Histograms for the fields that are preceded by #, !, &, or + qualifiers in the corresponding print. The Histograms that you can produce depend on which print qualifier is used:

Qualifier	Description
!	Produces a Count Histogram
&	Produces a Sum Histogram
+	Produces Count, Sum, and Mean Histograms
#	Produces Count, Sum, and Mean Histograms

Table 14: Histogram Qualifiers

Here is an example of a using a subtotal in a print, and then producing a Count Histogram:

Initial Print

```
Select OPTION: PRINT FILE ENTRIES
OUTPUT FROM WHAT FILE: SIGN-ON LOG//
SORT BY: DATE/TIME// +NODE NAME
START WITH NODE NAME: FIRST//
WITHIN NODE NAME, SORT BY:
FIRST PRINT FIELD: DATE/TIME
THEN PRINT FIELD: !NODE NAME
THEN PRINT FIELD:
(output is generated here)
```

Subtotal on a field in the Sort.

Use the "!" print qualifier (so that you will be able to produce a count histogram on the node name field).

Generating the Histogram

```
Select OPTION: OTHER OPTIONS
Select OTHER OPTION: STATISTICS
Select STATISTICAL ROUTINE: HISTOGRAM
DEVICE: HOME// SYSTEM

COUNT, NODE NAME, BY NODE NAME

ISC6A1 | *****
ISC6A2 | *****
ISC6A3 | *****
ISC6A4 | *****
+-----+-----+-----+-----+-----+-----+
      8    16    24    31    39    47    55    63
```

Figure 88: Initial Print Dialogue and Generation of a Count Histogram

7. System Management

VA FileMan is designed to be used either with Kernel or as a stand-alone application running under a variety of implementations of ANSI standard M. If VA FileMan is used without Kernel, the basic DBMS features of VA FileMan all work as described in the manuals. However, there are some features (e.g., bulletin-type cross-references, print queuing, and filegrams) that do not work without portions of Kernel. Whenever Kernel is needed to support a particular VA FileMan feature, that fact is mentioned in the manuals.

The installation of VA FileMan V. 22.0 is not integrated with the installation of Kernel. The *VA FileMan Installation Guide* contains instructions on how to install VA FileMan, both for stand-alone sites and for sites running Kernel.

Setup

^DINIT

Before any user program is used, VA FileMan's DINIT routine must be run on your system to initialize VA FileMan. The DINIT routine needs to be run only once, although it is nondestructive if run again. If VA FileMan is being installed on a system with the rest of Kernel, see also the Installation Guide for information about installing VA FileMan.

For more information on running the DINIT routine, please refer to the *VA FileMan Installation Guide*.

Security

VA FileMan provides tools for application packages to protect their data. VA FileMan identifies users by a number in the local variable DUZ and user security by codes stored in the local variable DUZ(0).

The "Data Security" chapter in this manual describes the use and setup of file, field, and template security.

Standalone VA FileMan

Device Handling for Stand-alone VA FileMan

VA FileMan requires a %ZIS routine. Kernel supplies a %ZIS as the device selection gateway to its device handler component. In addition to writing your own device selection routine and saving it as %ZIS in the Manager Account, stand-alone users have two possibilities:

1. You may have a device selection routine supplied by your M vendor. You can use the M vendor's routine provided that it returns the variables expected by VA FileMan from such a device selection program. These variables are listed below. In this case, you simply create a %ZIS routine that calls the vendor-supplied routine.

However, even if you use a vendor's (or your own) routine for device selection, you must have %ZISS, as described below, in your Manager Account, if you want to use VA FileMan's screen-oriented utilities.

2. If you do not have another device selection routine, refile the DIIS and DIISS routines as described in the *VA FileMan Installation Guide*. This results in all VA FileMan output going to the terminal that requests it. If you do not modify the %ZIS and %ZISS routines as described below, your terminal will be treated as a VT100 (ANSI) terminal.

VA FileMan controls terminals by using terminal characteristics stored in IO variables. In addition, certain operating system dependent actions are controlled by executing code stored in %ZOSF nodes. Together the IO variables and %ZOSF nodes allow full use of VA FileMan in both scrolling and screen-oriented modes. The instructions below describe how to modify the %ZIS and %ZISS routines in order to set the necessary IO variables, and how to set the necessary %ZOSF nodes.

Setting IO variables: %ZIS and %ZISS

%ZIS sets the IO variables required for terminal output that is not screen-oriented. The DIIS routine supplied with VA FileMan sets the IO variables to the values specific to the VT100 terminal type. If you are using or emulating a VT100 terminal, you can rename the DIIS routine unmodified as %ZIS. If you are using or emulating a VT220 or VT320 terminal, you must modify %ZIS to set IOST equal to "C-VT220" or "C-VT320".

The variables returned by %ZIS are:

Variable	Description
IO	The device \$I . If IO is null (""), no input or output occurs.
IOM	The margin width (e.g., 80).
ION	The device name, consisting of 1 to 30 alphanumeric characters.
IOSL	The screen length (e.g., 24).
IOF	The indirect argument of a WRITE statement to generate a top-of-page (e.g., #).
IOST	The output device type (e.g., CRT). If IOST begins with the letter C , the Inquire, Search, and Print output programs will wait till the user presses the Enter/Return key after each screen's worth of display. If IOST begins with a P , output will terminate with a page feed. If IOST contains SINGLE , output will stop after each page feed and wait for the Enter/Return key to be pressed (< RET >). If the output terminal is other than the terminal requesting the output, and IOST does <i>not</i> contain K , the < RET > will be read from the requesting terminal.
IOPAR	The parameter that should follow the first colon in the argument of the OPEN command. For most devices, this string should be null.
IOT	Equal to a string naming the device type (e.g., IOT=TRM). This variable must be returned equal to the string SDP in order for VA FileMan's multiple-copies feature to be called.
IOXY	The executable M code that performs cursor positioning given the input variables DX and DY . DX and DY contain the column and row positions, respectively, to which to move the cursor.

Table 15: %ZIS Variables Returned

The %ZISS routine sets the IO variables required by VA FileMan's screen-oriented utilities. The DISS routine supplied by VA FileMan sets the IO variables according to the value of IOST. DISS recognizes IOST values of C-VT220 and C-VT320. If

IOST equals anything else, the IO variables are set to values specific to the VT100 terminal type.

Not all of the variables returned by %ZISS are required by VA FileMan's screen-oriented utilities.

The variables returned by %ZISS are:

Variable	Description
IOAWM0	Auto wrap mode off
IOAWM1	Auto wrap mode on
IOCOMMA	Keypad's comma key
IOCUB	Cursor backward
IOCUD	Cursor down
IOCUF	Cursor forward
IOCUU	Cursor up
IODCH	Delete character
IODL	Delete line
IODO	Do key
IOEDALL	Erase in display entire page
IOEDEOP	Erase in display from cursor to end of page
IOELALL	Erase in line entire line
IOELEOL	Erase in line from cursor to end of line
IOENTER	Keypad's enter key
IOFIND	Find key

Table 16: %ZISS Variables Returned

Table 16 (continued):

Variable	Description
IOHELP	Help key
IOICH	Insert character
IOIL	Insert line
IOINHI	High intensity
IOINLOW	Low intensity
IOINORM	Normal intensity
IOINSERT	Insert key
IOIRM0	Replace mode
IOIRM1	Insert mode
IOKP0	Keypad 0 key
IOKP1	Keypad 1 key
IOKP2	Keypad 2 key
IOKP3	Keypad 3 key
IOKP4	Keypad 4 key
IOKP5	Keypad 5 key
IOKP6	Keypad 6 key
IOKP7	Keypad 7 key
IOKP8	Keypad 8 key
IOKP9	Keypad 9 key

Table 16: %ZISS Variables Returned (continued)

Table 16 (continued):

Variable	Description
IOKPAM	Keypad application mode on
IOKPNM	Keypad numeric mode on
IOMINUS	Keypad's minus key
IONEXTSC	Next screen key
IOPERIOD	Keypad's period key
IOPF1	Function key 1
IOPF2	Function key 2
IOPF3	Function key 3
IOPF4	Function key 4
IOPREVSC	Previous screen key
IOREMOVE	Keypad's remove key
IORI	Reverse index
IORVOFF	Reverse video off
IORVON	Reverse video on
IOSGR0	Turn off select graphic rendition attributes
IOSELECT	Select key
IOSTBM	Set top and bottom margins
IOUOFF	Underline off
IOUON	Underline on

Table 16: %ZISS Variables Returned (continued)

Table 16 (continued):

Variable	Description
IOBLC	Bottom left corner
IOBRC	Bottom right corner
IOBT	Bottom "T"
IOG0	Graphics off
IOG1	Graphics on
IOHL	Horizontal line
IOLT	Left "T"
IOMT	Middle "T", or cross hair (+)
IORT	Right "T"
IOTLC	Top left corner
IOTRC	Top right corner
IOTT	Top "T"
IOVL	Vertical line

Table 16: %ZISS Variables Returned (continued)

After you save DISS as %ZISS, you can modify %ZISS if you wish to use ScreenMan on terminal types other than those supported in DISS. The routine DISS itself contains more information on how to modify the routine.

IO variables and DataTree MUMPS—If your version of DataTree MUMPS supports VT220 emulation, set up %ZIS and %ZISS for VT220 and use the emulation.

Summary of IO Setups

Depending on your terminal type, you need to do the following to make full use of VA FileMan's screen-oriented utilities.

Terminal Type	Description
VT100	No action needed; the default settings are acceptable.
VT220, VT320	Edit the %ZIS routine to set IOST variable to " C-VT220 " or " C-VT320 ".
Other terminal types	Edit %ZIS to set IOST to " C-WHATEVER " and IOXY to the code to position the cursor for that terminal. Modify %ZISS routine to set all the IO variables for your terminal type. The routine contains instructions for a simple modification strategy.

Table 17: Optimal Procedures for Screen-oriented Utilities—Based on Terminal Type

NEW PERSON File for Stand-alone VA FileMan

In general, the files you need to run VA FileMan without Kernel are installed by the DINIT routines. However, one file that is referenced by VA FileMan is not included—the NEW PERSON file (#200). The NEW PERSON file is supplied by Kernel.

This section describes the fields in the NEW PERSON file directly accessed by VA FileMan; this is a small subset of the fields in Kernel's NEW PERSON file. The fields described contain characteristics of the VA FileMan users. If you set up a file in the proper global location with these fields, you will enhance stand-alone VA FileMan's functionality. However, the NEW PERSON file is *not* required to run stand-alone VA FileMan.

The file that needs to be established is File #200 (NEW PERSON) with a global root of ^VA(200,. Use the information below when creating the file using the Modify File Attributes option.

For a description of USER() function, please refer to the "VA FileMan Functions" chapter in the **HTML version** of the *VA FileMan Advanced Programmer Manual* located on the VA FileMan Home Page at:

<http://www.vista.med.va.gov/softserv/infrastr.uct/fileman/>

The fields directly accessed are:

Field Name	Field #	Node;Piece	Description
NAME	.01	0;1	Identifies the user. It is pointed to and displayed in several places. A FREE TEXT field holding from 3 to 30 characters.
INITIAL	1	0;2	Used by the USER() function. A FREE TEXT field holding from 2 to 5 characters.
TITLE	8	0;9	Used by the USER() function. A POINTER TO A FILE field that points to the TITLE file (#3.1) located at ^DIC(3.1,. You will need to define this file to use USER("T").
NICK NAME	13	.1;4	Used by the USER() function. A FREE TEXT field holding from 1 to 10 characters.
FILE RANGE	31.1	1;1	Used to assign numbers to newly created files. A FREE TEXT field with the format nnnnn-nnnnn.
TEXT TERMINATOR	31.2	1;4	Holds the default text terminator used by the Line Editor. A FREE TEXT field holding from 1 to 5 characters.

Table 18: NEW PERSON File Fields that Enhance Stand-alone VA FileMan

Table 18 (continued):

Field Name	Field #	Node;Piece	Description
PREFERRED EDITOR	31.3	1;5	Holds the user's Preferred Editor. A POINTER TO A FILE field that points to the ALTERNATE EDITOR file (#1.2).
TYPE AHEAD	200.09	200;9	Used to determine if "type ahead" is allowed for the user. A SET OF CODES field: "Y" = allowed; "N" = not allowed. Default is "N."

Table 18: NEW PERSON File Fields that Enhance Stand-alone VA FileMan (continued)

In addition to these fields accessed directly by VA FileMan, Kernel uses the NEW PERSON file to set up VA FileMan key variables. You can define additional NEW PERSON file fields to use to define these local variables as follows:

Field Name	Field #	Node;Piece	Description
Internal Entry Number	—	—	Used to set DUZ for the user. There is no defined .001 field on the NEW PERSON file.
FILE MANAGER ACCESS CODE	3	0;4	Used to set DUZ(0) for user. A FREE TEXT field from 1 to 15 characters.
LANGUAGE	200.07	200;7	Used to set DUZ("LANG"). A POINTER TO A FILE field that points to the LANGUAGE file (#.85) identifying the user's language.
TIMED READ (# OF SECONDS)	200.1	200;10	Used to set DTIME for the user. A NUMERIC field with a value of 1 to 99999.

Table 19: NEW PERSON File Fields to Define Key Variables in VA FileMan

When these additional fields are defined, you can use them in a signon routine to set these key variables.

Of course, you may choose to place additional information about your users in the NEW PERSON file (#200). If you add other fields to your NEW PERSON file, use field numbers greater than 10,000 and use subfile numbers with at least 5 digits following the decimal place. Also, place the fields in global nodes subscripted with numbers greater than 10,000. If you numberspace your data elements in this way, you will be able to avoid conflicts, if you later install Kernel's NEW PERSON file.

^%ZOSF Nodes

Manually Setting ^%ZOSF Nodes

VA FileMan's screen-oriented utilities execute M operating system-specific code contained in ^%ZOSF nodes. Running the DINZMGR routine in the Manager Account, as explained in the *VA FileMan Installation Guide*, sets the necessary nodes. However, DINZMGR can only set the nodes for some operating systems. If you want to use the screen-oriented features but your operating system is *not* supported by DINZMGR, you *must* set the nodes yourself.

The ^%ZOSF nodes and their meanings are listed below. Remember that the values stored in these nodes must be M code that, when executed, will perform the indicated function. For example, X ^%ZOSF("EOFF") would need to turn off the echo to the current device.

^%ZOSF Node	Description
EOFF	Turns off echo to the \$I device.
EON	Turns on echo to the \$I device.
NO-TYPE-AHEAD	Turns off type-ahead for the \$I device.
RM	Sets the \$I width to X characters.
TRMOFF	Resets terminators to normal.
TRMON	Turns on all control characters as terminators.
TRMRD	Returns in Y what terminated the last read.
TYPE-AHEAD	Allows type-ahead for the \$I device.
XY	Sets \$X=DX and \$Y=DY .

Table 20: Description of the ^%ZOSF Nodes

Alternate Editors

Setting Up Alternate Editors

VA FileMan supplies two editors, the Line and Screen Editors, for entering and changing text in WORD-PROCESSING-type fields. Other editors can be made available by using the ALTERNATE EDITOR file (#1.2). Entries in this file specify the M code used to call the Alternate Editor and to restore the VA FileMan environment after work in the editor is complete.

The user can choose an editor in two ways:

1. The PREFERRED EDITOR field in the NEW PERSON file (#200) is a pointer to the ALTERNATE EDITOR file (#1.2). Any entry in the ALTERNATE EDITOR file can be selected as a Preferred Editor. Then, whenever a WORD-PROCESSING-type field is presented for editing, the user is automatically switched into this Preferred Editor.
2. From the Line Editor, the user can switch to any of the editors in the ALTERNATE EDITOR file temporarily by using the Editor Change option on the UTILITIES submenu. After exiting the chosen editor, the user is returned to the Line Editor.

The "Choice of Word Processing Editors" chapter of the *VA FileMan Getting Started Manual* contains additional information about selecting editors.

ALTERNATE EDITOR File Entries

The requirements of the ALTERNATE EDITOR file's fields are explained in the following example of the creation of an entry in that file:

```
Select OPTION: ENTER OR EDIT FILE ENTRIES
INPUT TO WHAT FILE: ALTERNATE EDITOR <RET> (2 entries)
EDIT WHICH FIELD: ALL// <RET>
Select ALTERNATE EDITOR: VMSED
Are you adding 'VMSED' as a new ALTERNATE EDITOR (the 3RD)? No// YES <RET>
(Yes)
```

Figure 89: An Example of Creating an ALTERNATE EDITOR File Entry

An entry needs to be added to the ALTERNATE EDITOR file. The NAME of every entry must begin with a unique character. This name is used to select the editor.

The required ACTIVATION CODE FROM DIWE field contains M code that will invoke the Alternate Editor. In this case, a routine supplied by Kernel that invokes the VMS editor is called:

```
ACTIVATION CODE FROM DIWE: G ^XTEDTVXD
```

Usually, this code will need to extract the word processing data from the WORD-PROCESSING-type field, present it to the Alternate Editor, and return the edited text to the WORD-PROCESSING-type field. DBS calls should be used to retrieve and file the text.

For example, if the text to be edited were in Field #56 of File #1234 use the following Data Retriever call to extract the text for entry 789:

```
S MYFDA="^TMP("MYDATA", $J) " D GETS^DIQ(1234, "789, ", 56, "", MYFDA)
```

The text returns in nodes descendent from ^TMP("MYDATA", \$J, 1234, "789", 56).

After editing is complete, you can file the data from the same global array by using the following commands:

```
S MYFDA="^TMP("MYDATA") " D FILE^DIE("", "MYFDA")
```

For more details of the use of these calls, please refer to the descriptions of the Data Retriever, Filer, and Word Processing Filer in the "Database Server (DBS) API" chapter of the *VA FileMan Programmer Manual*.

This task of returning the data to the WORD-PROCESSING-type field can also be accomplished by code in the RETURN TO CALLING EDITOR field (see below).

If the editor uses any local M variables beginning with "D", they should be NEWed to avoid problems upon return to VA FileMan. Also, avoid calls to VA FileMan utilities in the fields that accept M code so that variables upon which VA FileMan depends—like **DA** and **D0**—are not changed.

The OK TO RUN TEST field contains code that checks to determine whether it is OK to run the editor:

```
OK TO RUN TEST: I ^%ZOSF("OS") ["VAX"&(DUZ(0) ["@"
```

This field is optional; if nothing is entered, there are no restrictions on the use of the editor. The code should set **\$T** to true if it is OK to proceed or to false if it is not. If the code returns **\$T=false**, the user will automatically return to the Line Editor. In this example, the environment is being checked to ensure that the called editor is available and it is verified that the user has the required VA FileMan Access Code.

M code entered into the optional RETURN TO CALLING EDITOR field can be used to restore the environment needed by the Line Editor:

```
RETURN TO CALLING EDITOR: <RET>
```

Since the user can switch editors at will, it is safest to restore the text to its previous location in the global and to maintain the local symbol table, as mentioned above. If these tasks are accomplished by code in the ACTIVATION CODE FROM DIWE field or by the called routine, this field is unnecessary.

The edited text *must* be restored; VA FileMan will *not* move text back to the proper global location.

```
DESCRIPTION:
  1>The VMS editor.
  2> <RET>
EDIT Option: <RET>
Select ALTERNATE EDITOR:
```

Figure 90: An Example where the User is Prompted to Choose an Alternate Editor

The definition of the Alternate Editor is complete. An editor's developer should provide information needed to set up an ALTERNATE EDITOR file entry. The local site manager has flexibility in setting up the editor. In particular, the OK TO RUN TEST field can be used to enforce local policies regarding access to editors.

COMPILED ROUTINE File

COMPILED ROUTINE File Cleanup: ENRLS^DIOZ()

The COMPILED ROUTINE file (#.83) stores a list of numbers used to assign names to compiled sort routines. When a compiled SORT template is used in a print, the next available routine number is selected from the COMPILED ROUTINE file. The routine name is then set to ^DISZ, concatenated with up to three zeros and the number from the COMPILED ROUTINE file (e.g., if the number is four, the routine name becomes ^DISZ0004). After the print finishes, the routine number is released, and the routine is deleted. However, if the system goes down, the number may not be released. This procedure allows the site manager to release one or all numbers on the COMPILED ROUTINE file for reuse and to delete the associated routine(s) from the system.

This procedure should never be included in application code. It should only be run from the M programmer prompt. The routine should be run only when the system is inactive to avoid inadvertently deleting a routine that is in use.

Format

```
ENRLS^DIOZ(ROUTINE_IEN)
```

Input Parameters

ROUTINE_IEN	(Optional) Internal Entry Number of the compiled routine number to be released. If passed as null or zero or if the parameter string is empty, all the numbers in the file are released.
-------------	--

Output

There is no output from this routine. The routine simply sets a flag on one or more entries in the COMPILED ROUTINE file (#.83), indicating that the entry number is available for reuse.

EXAMPLES

Example 1

To release routine number three for reuse and to delete routine ^DISZ0003, do the following:

```
>D ENRLS^DIOZ(3)
```

Example 2

To release all routine numbers for reuse and to delete all of the associated ^DISZnnnn routines for each routine number "nnnn," do the following:

```
>D ENRLS^DIOZ()
```

Part II: File Management

Part II: File Management

8. List File Attributes

The structures of VA FileMan files are stored in the data dictionary (DD). There, you can find the specifications of every field in every file. Frequently, you need to know the information in the DD (usually field names and descriptions) to successfully access and use the data in VA FileMan's files.

The Data Dictionary Utilities submenu contains the following utilities that show information about files:

- List File Attributes
- Map Pointer Relations
- Check/Fix DD Structure

List File Attributes Option

To get a listing of the fields in a file (and other file attributes), use the List File Attributes option. This listing displays the structure of the file and the characteristics of the fields in the file; it does not show entries, records, or any data contained in the file. This information can be very useful when deciding what fields to include in a report, or what fields to edit.

You have your choice of the following formats for the listing:

- Brief
- Condensed
- Standard (or Modified Standard)
- Custom-Tailored
- Templates Only
- Global Map
- Indexes and Cross-References Only
- Keys Only

First, choose the file to display information about; you can use either its file number or name.

List File Attributes

When you select the file, you have the option of requesting a range of files. If you select a range of files, the file number of the "go to" file must be higher than the file number of the "start with" file.

If you are prompted "Select SUB-FILE:", this indicates that the file you are working with has Subfiles. If you want information only about a Subfile, specify the Subfile at this prompt. If you don't choose a Subfile, your listing usually will include information about all fields in the file, including those in all Subfiles.

Next, choose a format for the listing:

```
Select LISTING FORMAT: STANDARD// ?
ANSWER WITH LISTING FORMAT NUMBER, OR NAME
CHOOSE FROM:
  1      STANDARD
  2      BRIEF
  3      CUSTOM-TAILORED
  4      MODIFIED STANDARD
  5      TEMPLATES ONLY
  6      GLOBAL MAP
  7      CONDENSED
  8      INDEXES AND CROSS-REFERENCES ONLY
  9      KEYS ONLY
```

Figure 91: File Attribute Listing Format Choices

Brief Data Dictionary

When you choose Brief as the data dictionary format, a brief listing will be produced; the Brief format is more readable but less complete than the default of a Standard listing. Next, you are asked for a destination for the listing's output at the "DEVICE:" prompt. You can specify any valid printer or press the Enter/Return key to send output to your screen as illustrated below:

```
Select LISTING FORMAT: STANDARD// BRIEF
ALPHABETICALLY BY LABEL? NO// <RET>

DEVICE: <RET>
```

Figure 92: Choosing the Brief Listing to Display on Your Screen

Here is a sample of a Brief data dictionary listing of an elementary file of patients:

```

BRIEF DATA DICTIONARY #16026 -- PATIENT FILE          05/31/91  PAGE 1
SITE: KDEMO V7   UCI: VAH,KXX
-----
NAME                16026,.01   FREE TEXT
                    Answer must be 3-30 characters in length.
SEX                 16026,1     SET
                    'm' FOR MALE;
                    'f' FOR FEMALE;
DATE OF BIRTH      16026,2     DATE
                    TYPE A DATE BETWEEN 1/1/1860 AND 1963
RELIGION            16026,3     POINTER TO RELIGION FILE (#13)
DIAGNOSIS           16026,4   16026.04
  Multiple
DIAGNOSIS           16026.04,.01  FREE TEXT
                    Answer must be 3-30 characters in length.
AGE AT ONSET        16026.04,1   NUMBER
                    Type a Number between 0 and 100, 0 Decimal Digits
HISTORY             16026.04,2   16026.42  WORD-PROCESSING
PROVIDER            16026,5     VARIABLE POINTER
                    FILE  ORDER  PREFIX  LAYGO  MESSAGE
                    6     1     S      n     STAFF PROVIDER
                    16    2     O      y     OTHER PROVIDER
SSN                 16026,6     FREE TEXT
  Social Security Number                    Enter 9 numbers without dashes.

```

Figure 93: An Example of a Brief Data Dictionary Listing

The information in the data dictionary reports originated in the definition of the file and its fields.

The "Creating Files and Fields" chapter in this manual explains in detail the source of the information displayed by the List File Attributes option.

This data dictionary listing tells you that for each patient, the following information may be available:

- A NAME that is from 3 to 30 characters long.
- A recorded SEX of either **m** (MALE) or **f** (FEMALE).
- A DATE OF BIRTH.
- A RELIGION (for a list of all valid religions, we would have to consult a RELIGION file).
- One or more diagnoses and for each DIAGNOSIS; DIAGNOSIS is a Multiple-valued field that has the following information:
 - An AGE AT ONSET
 - A HISTORY
- A PROVIDER (e.g., a primary care physician). For a list of valid PROVIDERs, you would consult File #6 and then File #16. If the PROVIDER's name does not appear, it can then be entered in File #16, since LAYGO (Learn-As-You-Go) has been allowed.
- A SOCIAL SECURITY NUMBER (SSN).

Condensed Data Dictionary

Another format for listing a file's attributes is the Condensed format, and the following example illustrates a Condensed data dictionary listing:

```

CONDENSED DATA DICTIONARY---PATIENT FILE      (#16026)UCI: VAH,KXX
STORED IN: ^DIZ(16026,                          05/31/91      PAGE 1
-----
                                FILE SECURITY

1          SEX (RS), [0;2]
2          DATE OF BIRTH (RD), [0;3]
3          RELIGION (P13'), [0;4]
4          DIAGNOSIS (Multiple-16026.04), [1;0]
   .01     DIAGNOSIS (MF), [0;1]
     1     AGE AT ONSET (NJ3,0), [0;2]
     2     HISTORY (Multiple-16026.42), [1;0]
       .01 HISTORY (W), [0;1]
5          PROVIDER (V), [2;1]
6          SSN (RFa), [2;2]

```

Figure 94: An Example of a Condensed Data Dictionary Listing

The codes in parentheses following the field names in the Condensed data dictionary contain information regarding the specifications of the field.

Here is a complete list of those codes and their meanings:

Code	Description
a	The field has been marked for auditing all the time.
e	The auditing is only on edit or delete.
A	For Multiples, new subentries can be added without being asked.
BC	The data is Boolean computed (true or false) and C the data is computed .
Cm	The data is Multiline computed .
D	The data is date-valued .
DC	The data is date-valued, computed .
F	The data is FREE TEXT .
I	The data is uneditable.
Jn	To specify a print length of " n " characters.
Jn,d	To specify printing " n " characters with " d " decimals .
K	The data is M code.
M	For Multiples, the user is asked for another subentry.
N	The data is NUMERIC-valued .
O	The field has an OUTPUT transform .
Pn	The data is a POINTER TO A FILE reference to file " n ".
Pn'	LAYGO to the pointed-to file is not allowed.
R	Entry of data is required .

Table 21: Condensed Data Dictionary Codes

Table 21 (continued):

Code	Description
S	The data is from a discreet SET OF CODES .
V	The data is a VARIABLE-POINTER .
W	The data is WORD-PROCESSING .
WL	The WORD-PROCESSING data is normally printed in line mode (i.e., without word wrap).
X	Editing is not allowed under the Modify File Attributes option, because the INPUT transform has been modified under the Utility Functions submenu.
*	There is a screen associated with a POINTER TO A FILE, VARIABLE-POINTER, or SET OF CODES DATA TYPEs .

Table 21: Condensed Data Dictionary Codes (continued)

For example, the SSN field is required (**R**), is FREE TEXT (**F**), and is audited (**a**).

Standard and Modified Standard Data Dictionaries

The most complete information about a file is obtained by using the Standard data dictionary format, which is the default for the List File Attributes option. In addition to detailed information about every field in the file, the Standard data dictionary format gives the file access, identifiers, cross-references, other files pointing to the file, files pointed to by the file, and any templates (including forms and blocks) associated with the file.

Standard Format

Here is a sample data dictionary in Standard format:

```

STANDARD DATA DICTIONARY #16026 -- PATIENT FILE                05/31/91  PAGE 1
STORED IN ^DIZ(16026, (1 ENTRY)  SITE: KDEMO V7  UCI: VAH,KXX

DATA          NAME          GLOBAL          DATA
ELEMENT       TITLE         LOCATION       TYPE
-----
A sample file containing some of the fields found in a file of patient
information in a hospital database.

    Used to print information from the DIAGNOSIS multiple.
SORT TEMPLATE(S) :
FORM(S) /BLOCKS(S) :

```

Figure 95: An Example of a Standard Data Dictionary Listing (continued)

Modified Standard Format

Another data dictionary format is the Modified Standard format, which allows you to suppress printing the M code and to restrict the listing to specified groups of fields.

For example, the following dialogue eliminates the M code from the Standard listing and only prints those fields in the DEMOG group (NAME, SEX, DATE OF BIRTH, and SSN):

```

Select LISTING FORMAT: STANDARD// MODIFIED STANDARD
WANT THE LISTING TO INCLUDE MUMPS CODE? N// <RET>
WANT TO RESTRICT LISTING TO CERTAIN GROUPS OF FIELDS? NO// Y
Include GROUP: DEMOG
And include GROUP: <RET>

```

Figure 96: Choosing the Modified Standard Data Dictionary Listing

If you answer the question concerning M code YES and do not specify any groups, the output from the Modified Standard format will be the same as that of the Standard format.

Custom-Tailored Data Dictionary

The Custom-Tailored format allows you to select attributes of the fields for your report. You decide what information will be displayed, and you determine the printed format of the output.

The techniques used to control the format of output are described in detail in the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

For this simple example we accept the default settings:

```
Select DATA DICTIONARY UTILITY OPTION: LIST FILE ATTRIBUTES
START WITH WHAT FILE: PATIENT // <RET>
GO TO WHAT FILE: PATIENT // <RET>
Select SUB-FILE: <RET>
Select LISTING FORMAT: STANDARD// CUSTOM-TAILORED
SORT BY: LABEL// ?
ANSWER WITH ATTRIBUTE NUMBER, OR LABEL
DO YOU WANT THE ENTIRE ATTRIBUTE LIST? Y <RET> (YES)
```

Figure 97: Choosing the Custom-Tailored Data Dictionary Listing

The "SORT BY:" prompt allows you to specify the order in which the data dictionary information will be displayed.

List File Attributes

Here, we are asking for the entire list of possible attributes about a field that can be stored in the data dictionary. Typically, no field would have a value for every one of these attributes:

```
CHOOSE FROM:
.001      NUMBER
.01       LABEL
.1        TITLE
.12       VARIABLE POINTER (multiple)
.2        SPECIFIER
.23       LENGTH
.24       DECIMAL DEFAULT
.25       TYPE
.26       COMPUTE ALGORITHM
.27       SUB-FIELDS
.28       MULTIPLE-VALUED
.29       DEPTH OF SUB-FIELD
.3        POINTER
.4        GLOBAL SUBSCRIPT LOCATION
.5        INPUT TRANSFORM
1         CROSS-REFERENCE (multiple)
1.1      AUDIT
1.2      AUDIT CONDITION
2        OUTPUT TRANSFORM
3        'HELP'-PROMPT
4        XECUTABLE 'HELP'
8        READ ACCESS (OPTIONAL)
8.5     DELETE ACCESS (OPTIONAL)
9        WRITE ACCESS (OPTIONAL)
9.01    COMPUTED FIELDS USED
10       SOURCE
11       DESTINATION (multiple)
12       POINTER SCREEN
12.1    CODE TO SET POINTER SCREEN
12.2    EXPRESSION FOR POINTER SCREEN
20      GROUP (multiple)
50      DATE FIELD LAST EDITED
999     TRIGGERED-BY POINTER (multiple)
TYPE '-' IN FRONT OF NUMERIC-VALUED FIELD TO SORT FROM HI TO LO
TYPE '+' IN FRONT OF FIELD NAME TO GET SUBTOTALS BY THAT FIELD,
'#' TO PAGE-FEED ON EACH FIELD VALUE, '!' TO GET RANKING NUMBER,
'@' TO SUPPRESS SUB-HEADER, ']' TO FORCE SAVING SORT TEMPLATE TYPE [TEMPLATE
NAME] IN BRACKETS TO SORT BY PREVIOUS SEARCH RESULTS

SORT BY: LABEL// <RET>
START WITH LABEL: FIRST// <RET>
FIRST PRINT ATTRIBUTE: ?
ANSWER WITH ATTRIBUTE NUMBER, OR LABEL
DO YOU WANT THE ENTIRE 36-ENTRY ATTRIBUTE LIST? N <RET> (NO)
```

Figure 98: Choosing from a List of Field Attributes

At this point, you indicate the specific attributes of the fields that you want displayed.

Here, help regarding the print formatting options will be displayed:

```
TYPE '&' IN FRONT OF FIELD NAME TO GET TOTAL FOR THAT FIELD,
  '!' TO GET COUNT, '+' TO GET TOTAL & COUNT, '#' TO GET MAX & MIN,
  ']' TO FORCE SAVING PRINT TEMPLATE
TYPE '[TEMPLATE NAME]' IN BRACKETS TO USE AN EXISTING PRINT TEMPLATE
YOU CAN FOLLOW FIELD NAME WITH ';' AND FORMAT SPECIFICATION(S)
```

Figure 99: Help on Print Formatting in the Custom-Tailored Data Dictionary Listing

Now, by using either the label or the corresponding number of the attribute you want, you select the information you want in your customized data dictionary listing:

```
FIRST PRINT ATTRIBUTE: LABEL
THEN PRINT ATTRIBUTE: TYPE
THEN PRINT ATTRIBUTE: DATE FIELD LAST EDITED
THEN PRINT ATTRIBUTE: <RET>
HEADING: FIELD SEARCH// CUSTOM-TAILORED OUTPUT
DEVICE: <RET>
```

Figure 100: Selecting the Field Attributes You Want Printed

You can save the selected attributes in a PRINT template.

For details, please refer to the "Print: How to Print Reports from Files" chapter in the *VA FileMan Getting Started Manual*.

List File Attributes

The output will look like this:

PATIENT FILE CUSTOM-TAILORED OUTPUT			MAY 31,1991 11:10	PAGE 1
LABEL	TYPE	DATE FIELD	LAST EDITED	
DATE OF BIRTH	DATE/TIME		MAR 22,1991	
DIAGNOSIS	FREE TEXT			
NAME	FREE TEXT		MAR 29,1991	
PROVIDER	VARIABLE-POINTER		MAR 22,1991	
RELIGION	POINTER		MAR 22,1991	
SEX	SET		MAR 22,1991	
SSN	FREE TEXT		MAR 22,1991	

Figure 101: An Example of a Custom-Tailored Data Dictionary Listing

With the Custom-Tailored format, in order to get information about fields in a Multiple, you must specifically ask for that Multiple by entering its name at the "Select SUB-FILE:" prompt.

Templates Only Format

The Templates Only format displays information about the templates (including forms and blocks) associated with a file. The output resembles the last part of the Standard data dictionary output.

Global Map

The Global Map format shows the actual structure of the global (file) that contains the data for the file and its templates. This information is of primary interest to programmers who can control how data is stored.

Here is a sample Global Map:

```

GLOBAL MAP DATA DICTIONARY #16026 -- PATIENT FILE                05/31/91  PAGE 1
STORED IN ^DIZ(16026, (1 ENTRY)  SITE: KDEMO V7  UCI: VAH,KXX
-----

CROSS
REFERENCED BY: NAME(B)

^DIZ(16026,D0,0)= (#.01) NAME [1F] ^ (#1) SEX [2S] ^ (#2) DATE OF BIRTH [3D]

PRINT TEMPLATE(S) :
^DIPT(.01)= CAPTIONED
^DIPT(60)= ZZDIAGPRINT

SORT TEMPLATE(S) :

```

Figure 102: An Example of a Global Map Data Dictionary Listing

An understanding of these data dictionary listings is the key to displaying, changing, and deleting the data in individual file entries.

Indexes and Cross-References Only

The Indexes and Cross-References Only format shows the Traditional cross-references and New-Style indexes that are defined on a file.

Here is a sample Indexes and Cross-References Only data dictionary listing:

```

INDEX AND CROSS-REFERENCE LIST -- FILE #16026          12/24/98    PAGE 1
-----
File #16026

Traditional Cross-References:

B    REGULAR
      Field:  NAME    (16026,.01)
      Description:  Automatically created regular x-ref used to look-up and
                    sort entries based on the value in the .01 (NAME) field.
                    1) = S ^DIZ(16026,"B", $E(X,1,30),DA)=""
                    2) = K ^DIZ(16026,"B", $E(X,1,30),DA)

New-Style Indexes:

KEYA (#6)    RECORD    REGULAR    IR    LOOKUP & SORTING
Unique for:  Key A (#5), File #16026
Short Descr: Uniqueness Index for Key 'A' of File #16026
Set Logic:   S ^DIZ(16026,"KEYA",X(1),X(2),DA)=""
Kill Logic:  K ^DIZ(16026,"KEYA",X(1),X(2),DA)
Whole Kill:  K ^DIZ(16026,"KEYA")
              X(1):  NAME    (16026,.01)  (Subscr 1)
              X(2):  SSN    (16026,6)    (Subscr 2)

Subfile #16026.04

Traditional Cross-References:

B    REGULAR
      Field:  DIAGNOSIS (16026.04,.01)
              1) = S ^DIZ(16026,DA(1),1,"B", $E(X,1,30),DA)=""
              2) = K ^DIZ(16026,DA(1),1,"B", $E(X,1,30),DA)

```

Figure 103: An Example of an Indexes and Cross-References Only Data Dictionary Listing

Keys Only

The Keys Only format shows the keys that are defined on a file.

Here is a sample Keys Only data dictionary listing:

```
KEY LIST -- FILE #16026                12/24/98    PAGE 1
-----
FILE #16026
-----
PRIMARY KEY:          A (#5)
Uniqueness Index: KEYA (#6)
File, Field: 1) NAME (16026,.01)  2) SSN (16026,6)
```

Figure 104: An Example of a Keys Only Data Dictionary Listing

List File Attributes

Map Pointer Relations Option

The Map Pointer Relations option on the Data Dictionary Utilities submenu creates a graphic representation of the pointer relationships between files. (Files are linked by POINTER TO A FILE and VARIABLE-POINTER field types.)

These field types are described in the "Creating Fields" topic in the "Creating Files and Fields" chapter in this manual.

You select an application package, a file, or a group of files to be mapped. If you select a package to map, you are given the opportunity to exclude a file or files from the map. The initial dialogue goes like this:

```
Select DATA DICTIONARY UTILITY OPTION: MAP POINTER RELATIONS

Prints a graph of pointer relations in a database of FileMan files
named in the Kernel PACKAGE file (9.4) or given separately.
Works best with 132 column output!

Select PACKAGE NAME: <RET>

Enter files to be included
Add FILE: PATIENT
Add FILE: <RET>

Files included                16026  PATIENT

Enter name of file group for optional graph header: PATIENT FILE

DEVICE: HOME// <RET>
```

Figure 105: An Example of the Dialogue Encountered When Using the Map Pointer Relations Option

In this instance, only a single file, the PATIENT file, has been selected for mapping. Of course, a more useful and complex map would be produced if an entire package or a large, related group of files were mapped.

You must have DD access to the PACKAGE file (#9.4) and to the files chosen at the "Add FILE:" prompt.

The output consists of three columns. The middle column has the target file or files, each surrounded by a box. This is the file or group of files that you asked to be mapped. To the left, in the first column, are the files and fields that point to the target file. An abbreviated description of the field is shown. To the right, in the last column, are any files that are pointed to by the target file. The output's heading contains brief descriptions of the codes used.

A possible output for the PATIENT file is shown below:

```

File/Package:  PATIENT FILE                               Date:  MAY 31,1991

FILE (#)          POINTER          (#) FILE
POINTER FIELD     TYPE              POINTER FIELD     FILE POINTED TO
-----
L=Laygo          S=File not in set      N=Normal Ref.    C=Xref.
*=Truncated      m=Multiple              v=Variable Pointer

ADMISSIONS (#16999)
CLIENT ..... (N S L) -> | 16026  PATIENT |
                          | RELIGION   | -> RELIGION
                          | v PROVIDER  | -> PERSON
                          |                | -> PROVIDER

```

Figure 106: An Example of the Output Produced with the Map Pointer Relations Option

This output shows that the CLIENT field in the ADMISSIONS file points to the PATIENT file. LAYGO additions are allowed and the ADMISSIONS file is not in the set of files being mapped. Further, the RELIGION field in the PATIENT file points to the RELIGION file and the PROVIDER field, a "v" (VARIABLE-POINTER), points to the PERSON and PROVIDER files. If the target file points to a file that is not in the account, the map shows:

```
*** NONEXISTENT FILE ***
```

The "Pointer Map" section in the *VA FileMan Technical Manual* has a more elaborate example of a pointer map.

Check/Fix DD Structure Option

In order to ensure that the internal structure of your files and subfiles is consistent, use the Check/Fix DD Structure option from the Data Dictionary Utilities submenu. You must have READ access to the files being analyzed. In addition, you need DD access for this option to correct erroneous nodes.

This utility looks at a file's identifiers, cross-references, POINTER TO A FILE, VARIABLE-POINTER, and COMPUTED fields. If there are inconsistencies or conflicts between the information in the data dictionary and the structure of the file's global nodes, the Check/Fix DD Structure option will note them.

If you want, the Check/Fix DD Structure option will correct inconsistencies found in the data dictionary. The process will *not* change any file structures; it only removes or corrects unnecessary or incorrect DD nodes. Data is *not* affected.

The dialogue for running this option is simple. You specify the file or files you want to check and indicate whether you want to delete incorrect nodes. Then the progress of the checking is displayed followed by a report of any discrepancies found or any changes made. For example:

```
Select DATA DICTIONARY UTILITY OPTION: CHECK/FIX DD STRUCTURE

Check the Data Dictionary.

START WITH WHAT FILE: 16033
GO TO WHAT FILE: <RET>
Remove erroneous nodes? NO// YES
DEVICE: HOME// <RET> DECSERVER

Checking file # 16033
  Checking 'ID' nodes for 'Q'.
  Checking 'IX' nodes.
  Checking 'PT' nodes.
  File: 16037 Field: .01 is not a pointer.
    ^DD(16033,0,"PT",16037,.01) was killed.
  Checking FIELDS....
Checking subfile # 16033.04
  Checking 'IX' nodes.
  Checking FIELDS...
Checking subfile # 16033.42
  Checking FIELDS.
Returning to subfile 16033.04.
Returning to main file.....
Checking subfile # 16033.01
  Checking 'IX' nodes.
  Checking FIELDS.
Returning to main file.....
```

Figure 107: An Example of the Dialogue and Output Encountered When Using the Check/Fix DD Structure Option

In the previous example (Figure 107), the check is being run on a single file. Correction of erroneous nodes has been requested. An incorrect "PT" node was found and deleted.

Subfiles are inspected, too.

Application developers might use this tool to clean up their files before export. Site managers may find the reporting function useful for checking a package's files after installation. Erroneous nodes that are found by this option may be remnants of prior versions of the files; the current install may not be to blame.

9. Creating Files and Fields

Creating a File

To create a new file, use the Modify File Attributes option and enter the new file name (from 3 to 45 characters in length) when asked:

```
MODIFY WHAT FILE:
```

and respond with YES when asked "Are you adding 'xxxxxxx' as a new FILE?" (where "xxxxxxx" represents the new file name).

Naming a New File

File names should be chosen so that they can easily be distinguished from each other:

```
MODIFY WHAT FILE: ENT CLINIC PATIENT
```

Here's a tip—If different people are creating files, it can be helpful to include their initials, nick names, or other identifying phrases within the file name.

The name for your new file should not contain any arithmetic or string operators like + - * / \ _ or punctuation like a colon (":").

An internal number must be assigned to this new file. You are prompted with the next available internal file number. You can either simply press the Enter/Return key (a null response) to accept that number, or enter a number not already assigned to a file.

Your new file is now initialized. VA FileMan creates the NAME field (field number .01), which is free text, 3 to 30 characters in length, non-numeric, and has no leading punctuation. You will see the following message:

```
A FreeText NAME Field (#.01) has been created.
```

Creating Files and Fields

The .01 field's definition can be modified like any other field: it does not have to be FREE TEXT; its label need not be NAME; and so forth. The .01 field should be the key attribute of an entry used to identify it and to order the entries for lookups. (However, entries can be identified and ordered by other fields through cross-references.)

After creating a new file, you can define any number of fields for the new file, as described in the "Creating Fields" topic below.

For an example of a new file using the Modify File Attributes option, please refer to the "Examples of File and Field Creation" topic that follows.

Creating Fields

For any file, you can create fields describing logically related data that pertains to entries in that file. When created, every file automatically receives one field: a NAME field (the #.01 field). You must explicitly define any other fields. All such definitions are made (and changed) with the Modify File Attributes option.

When you create a file, after you give the new file a name, you are asked:

```
Select FIELD:
```

Enter a new field name and respond with YES when VA FileMan asks:

```
Are you adding 'xxxxxxx' as a new FIELD?
```

The "xxxxxxx" represents the name of the field you entered. After answering YES to this prompt, you are now ready to specify what sort of data the new field will contain. A field can only be *one* type of data; the choices are listed in the following section.

Field DATA TYPEs

There are nine DATA TYPEs:

No.	DATA TYPE	Description
1	DATE/TIME	Dates with or without time stamps.
2	NUMERIC	NUMERIC DATA TYPEs, including dollar values.
3	SET OF CODES	Codes that represent values (e.g., 1=MALE/2=FEMALE).
4	FREE TEXT	A single alphanumeric string of characters.
5	WORD-PROCESSING	A Multiline document of text.
6	COMPUTED	A virtual field, values not stored.
7	POINTER TO A FILE	Referencing an entry in some other file.
8	VARIABLE-POINTER	Referencing an entry in a defined set of files.
9	MUMPS	Used by programmers to enter M code.

Table 22: Data Types

You are asked for the DATA TYPE of any field you are creating. You must pick one of these nine choices. Data validation checks are then asked depending on the DATA TYPE entered. For some DATA TYPEs, a default "HELP" prompt is automatically composed.

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For examples of entering a field attributes in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

Screen Mode Field Editing

When using the Modify File Attributes option you can make your field entries in the traditional Scrolling Mode or choose to create, modify, or review a file's field attributes easily by running the Modify File Attributes option in Screen Mode.

To make your entries in Screen Mode, simply press the Enter/Return key to accept the default response at the "DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes//" prompt.

The following example illustrates using Screen Mode when editing the .01 field of the ORDER file (#100):

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER

Select FIELD: .01 <RET> ORDER #
```

Figure 108: Choosing Screen Mode When Using the Modify File Attributes Option

You will then be taken into Screen Mode where you can edit the properties of the field, as shown below:

```

Field #.01 in File #100
FIELD LABEL: ORDER #          DATA TYPE... NUMERIC
          TITLE:
          AUDIT:
AUDIT CONDITION:
  READ ACCESS:
  DELETE ACCESS:
  WRITE ACCESS:
  SOURCE:
DESCRIPTION...   TECHNICAL DESCRIPTION...

          IS THIS FIELD MULTIPLE... NO

  MANDATORY: YES
  HELP-PROMPT: Enter the order number.
EXECUTABLE HELP:
-----
NOTE THAT THIS FIELD'S DEFINITION IS NOT EDITABLE

          Press <PF1>H for help   Insert
  
```

Figure 109: An Example Using the Modify File Attributes Option in Screen Mode

Using the Screen Mode version of this option, after entering the field name or number (e.g., .01 field) after the "Select FIELD:" prompt, you are presented with a ScreenMan form (screen) that can be reviewed and edited like any other. In this example, the most important field on this screen is the DATA TYPE field in the upper right corner; it is a required entry. In this example, required entries in Screen Mode are indicated by a caption with a different color and an underline.

i Screen Mode highlights the captions for required fields with an underline. However, depending on your terminal or terminal emulator software and your personal preferences, the form of the highlight can vary (e.g., some emulators will highlight required field captions in reverse video, a different color, with an underline, or any combination of highlights).

For more information on ScreenMan forms and Screen Mode, please refer to the "ScreenMan" chapter in the *VA FileMan Getting Started Manual*.

In this case, the DATA TYPE field has been defined as NUMERIC and is *not editable* as indicated by the message displayed near the bottom of the screen (i.e., "NOTE THAT THIS FIELD'S DEFINITION IS NOT EDITABLE"); this is because a programmer has previously edited the definition in a special way. However, unlike the DATA TYPE field, the value of the HELP-PROMPT field (i.e., "Enter the Order number."), which is the message that is displayed to users when they enter a single question mark ("?",) while editing the ORDER # field, can be edited. The DESCRIPTION and TECHNICAL DESCRIPTION fields are multi-line WORD-PROCESSING fields; to edit them, press the Enter/Return key and a separate screen opens (i.e., a "pop-up" window). The DESCRIPTION is displayed to users who enter two question marks ("??") while editing the ORDER # field. The TECHNICAL DESCRIPTION, however, is for internal documentation only.

DATE/TIME DATA TYPE

A DATA TYPE defined as DATE/TIME allows you to enter a minimum and maximum date. You can also indicate whether the date can be entered with an imprecise date (e.g., JUL 1969) or with the time-of-day (e.g., JUL 20@4). VA FileMan does not accept dates before 1700.

For example, when defining a DATE/TIME DATA TYPE, you are asked the following questions:

```
Select FIELD: DATE OF BIRTH
  Are you adding 'DATE OF BIRTH' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF DATE OF BIRTH: DATE/TIME
EARLIEST DATE (OPTIONAL): 1/1/1860 <RET> (JAN 01, 1860)
LATEST DATE: 1963 <RET> (1963)
CAN DATE BE IMPRECISE (Y/N): YES// <RET>
CAN TIME OF DAY BE ENTERED (Y/N): NO// <RET> NO
```

Figure 110: Defining a DATE/TIME DATA TYPE Field in Scrolling Mode (1)

If you reply YES to the "CAN TIME OF DAY BE ENTERED (Y/N): NO//" prompt, you would then be asked "CAN SECONDS BE ENTERED?".

```
WILL DATE OF BIRTH FIELD BE MULTIPLE:  No// <RET>  (No)
IS DATE OF BIRTH ENTRY MANDATORY (Y/N):  NO// Y <RET>  YES
...
'HELP'-PROMPT:  TYPE A DATE BETWEEN 1/1/1860 AND 1963
                Replace <RET>
DESCRIPTION:
1> <RET>
```

Figure 111: Defining a DATE/TIME DATA TYPE Field in Scrolling Mode (2)

A default Help prompt is automatically written for you with the DATE/TIME DATA TYPE. You can change this prompt using the "Replace ... With" syntax.

-  This Help information is displayed when the user inputs a single question mark ("?") when editing this field.
-  You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a DATE/TIME DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

NUMERIC DATA TYPE

A DATA TYPE defined as NUMERIC requires you to enter the lowest and highest values allowed, the maximum number of decimal digits allowed, and to state whether dollar values are allowed (e.g., \$33).

For example, when defining a NUMERIC DATA TYPE, you are asked the following questions:

```
Select FIELD: AGE AT ONSET
Are you adding 'AGE AT ONSET' as a new FIELD? No// Y <RET> (YES)

DATA TYPE OF AGE AT ONSET: NUMERIC
INCLUSIVE LOWER BOUND: 0
INCLUSIVE UPPER BOUND: 100
IS THIS A DOLLAR AMOUNT (Y/N): NO// <RET>
```

Figure 112: Defining a NUMERIC DATA TYPE Field in Scrolling Mode (1)

If you answer YES at the "IS THIS A DOLLAR AMOUNT (Y/N):" prompt, VA FileMan would allow users to precede input data with a dollar sign ("\$\$") and show up to two decimal places.

```
MAXIMUM NUMBER OF FRACTIONAL DIGITS: 0// <RET>
WILL AGE AT ONSET FIELD BE MULTIPLE? No// <RET> (No)
IS AGE AT ONSET ENTRY MANDATORY (Y/N): NO// <RET> NO
....
'HELP'-PROMPT: Type a Number between 0 and 100, 0 Decimal Digits
                Replace <RET>
DESCRIPTION:
1> <RET>
```

Figure 113: Defining a NUMERIC DATA TYPE Field in Scrolling Mode (2)

A default Help prompt is automatically written for you with the NUMERIC DATA TYPE. You can change this prompt using the "Replace ... With" syntax.

This Help information is displayed when the user inputs a single question mark ("?") when editing this field.

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a NUMERIC DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

SET OF CODES DATA TYPE

A DATA TYPE defined as a SET OF CODES can be used to restrict a user to just a few possible values (e.g., YES or NO). When defining a SET OF CODES DATA TYPE, enter a valid code and a translation of what each code means. The user can enter the code, the full meaning, or a portion of the full meaning. If the field is set up to require only a one-character response (as shown in the example below), this DATA TYPE can simplify the user's data entry.

VA FileMan has only a limited amount of space to store the codes and their external values. If the limit is exceeded, you are told "TOO MUCH!--SHOULD BE A 'POINTER', NOT 'SET'." The SET OF CODES DATA TYPE is sometimes referred to as a SET.

For example, when defining a SET OF CODES DATA TYPE, you are asked the following questions:

```
Select FIELD: SEX
  Are you adding 'SEX' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF SEX: SET OF CODES
INTERNALLY-STORED CODE: m WILL STAND FOR: MALE
INTERNALLY-STORED CODE: f WILL STAND FOR: FEMALE
INTERNALLY-STORED CODE: <RET>
WILL SEX FIELD BE MULTIPLE: No// <RET> (No)
IS SEX ENTRY MANDATORY (Y/N): No// Y <RET> YES
...
'HELP' - PROMPT: <RET>
DESCRIPTION:
  1> <RET>
```

Figure 114: Defining a SET OF CODES DATA TYPE Field in Scrolling Mode

In this example, "m" stands for Male and "f" stands for Female. Numbers as well as alphabetic characters can be used.

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a SET OF CODES DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

FREE TEXT DATA TYPE

A DATA TYPE defined as FREE TEXT allows you to enter the maximum and minimum allowable string length of the FREE TEXT data. You can also enter an M PATTERN MATCH that input data will have to match.

For example, when defining a FREE TEXT DATA TYPE, you are asked the following questions:

```
Select FIELD: DIAGNOSIS
  Are you adding 'DIAGNOSIS' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF DIAGNOSIS: FREE TEXT
MINIMUM LENGTH: 3
MAXIMUM LENGTH: 30
(OPTIONAL) PATTERN MATCH (IN 'X'): <RET>
```

Figure 115: Defining a FREE TEXT DATA TYPE Field in Scrolling Mode (1)

The PATTERN MATCH is written in M code. If input data violates the PATTERN MATCH or the Minimum/Maximum lengths, the data is not accepted and the user is shown the Help prompt information.

```
WILL DIAGNOSIS FIELD BE MULTIPLE? No// Y <RET> (Yes)
IS DIAGNOSIS ENTRY MANDATORY(Y/N): NO// <RET> NO
SHOULD USER SEE AN "ADDING A NEW DIAGNOSIS?" MESSAGE FOR NEW
ENTRIES (Y/N): N <RET> NO
HAVING ENTERED OR EDITED ONE DIAGNOSIS, SHOULD USER BE ASKED
ANOTHER (Y/N): Y <RET> YES
```

Figure 116: Defining a FREE TEXT DATA TYPE Field in Scrolling Mode (2)

With these specifications, the user is not given a confirming message when new subentries are added to the Multiple. The user is allowed to enter several diagnoses in a row for a given patient.

```
....
....
'HELP'-PROMPT: Answer must be 3-30 characters in length.
                Replace <RET>
DESCRIPTION:
1> <RET>
```

Figure 117: Defining a FREE TEXT DATA TYPE Field in Scrolling Mode (3)

A default Help prompt is automatically written for you with the FREE TEXT DATA TYPE. You can change this prompt using the "Replace ... With" syntax.

This Help information is displayed when the user inputs a single question mark ("?) when editing this field.

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a FREE TEXT DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

WORD-PROCESSING DATA TYPE

A DATA TYPE defined as a WORD-PROCESSING field allows entry of unlimited free-text data. The data can be edited, formatted, and printed with word processing text editors.

For a description of VA FileMan's native text editors, please refer to the "Screen Editor" and "Line Editor" chapters in the *VA FileMan Getting Started Manual*.

For example, when defining a WORD-PROCESSING DATA TYPE, you are asked the following questions:

```
Select FIELD: HISTORY
Are you adding 'HISTORY' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF HISTORY: WORD-PROCESSING
SHALL THIS TEXT NORMALLY APPEAR IN WORD-WRAP MODE? Yes// <RET> (Yes)
....
....
'HELP'-PROMPT: SUBJECTIVE NARRATIVE OF PATIENT'S PROBLEM HISTORY
DESCRIPTION:
1> <RET>
```

Figure 118: Defining a WORD-PROCESSING DATA TYPE Field in Scrolling Mode

If you answer YES to the "SHALL THIS TEXT NORMALLY APPEAR IN WORD-WRAP MODE" question, text is automatically wrapped at word boundaries to fit in the column in which it is being printed. Usually, this is the preferred way to print text.

Here's a tip—When it is important that lines of text be printed exactly as they were entered, answer NO to the "SHALL THIS TEXT NORMALLY APPEAR IN WORD-WRAP MODE" question. Thus, text is output in no-wrap mode. You would probably want a spreadsheet or a restaurant menu printed in no-wrap mode.

i If the column in which no-wrap text is being printed is too short to accommodate the line of text, your printer may break the line in the middle of words or otherwise destroy the formatting of the text.

i You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a WORD-PROCESSING DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

COMPUTED DATA TYPE

When a DATA TYPE is defined as COMPUTED its value is determined at the time the field is accessed. This computation is based on an expression stored in the data dictionary. The field value (or data) itself is not stored in the data dictionary. The COMPUTED expression is constructed using field names, literals or constants, functions, and operators.

i For a complete explanation of these elements, please refer to the "Computed Expressions" chapter in this manual.

i The functions referred to above are VA FileMan functions stored in the FUNCTION file (#.5), not M functions. A developer with programmer access can also enter M code in a COMPUTED field. The M code must set the variable "X" to the COMPUTED field value.

For example, when defining a COMPUTED DATA TYPE, you are asked the following questions:

```
Select FIELD: AGE
  Are you adding 'AGE' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF AGE: COMPUTED

'COMPUTED-FIELD' EXPRESSION: TODAY-(DATE OF BIRTH)\365.25

....
NUMBER OF FRACTIONAL DIGITS TO OUTPUT (ONLY ANSWER IF NUMBER-VALUED): 2
```

Figure 119: Defining a COMPUTED DATA TYPE Field in Scrolling Mode (1)

For this example, we assume the DATE OF BIRTH field was previously created. Thus, we can reference it in the "COMPUTED-FIELD' EXPRESSION". Also, the "NUMBER OF FRACTIONAL DIGITS TO OUTPUT" question is asking whether you should enter the number of digits that should normally appear to the right of the decimal point when this field is displayed.

```
SHOULD VALUE ALWAYS BE INTERNALLY ROUNDED TO 2 DECIMAL PLACES? No// Y <RET>
(Yes)
WHEN TALLING THIS FIELD, SHOULD THE SUM BE COMPUTED FROM
    THE SUMS OF THE COMPONENT FIELDS? No// <RET> (No)
LENGTH OF FIELD: 8// <RET>
```

Figure 120: Defining a COMPUTED DATA TYPE Field in Scrolling Mode (2)

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a COMPUTED DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

POINTER TO A FILE DATA TYPE

A DATA TYPE defined as a POINTER TO A FILE requires you to enter the name or number of the pointed-to file and that file must already exist (defined previously).

For example, when defining a POINTER TO A FILE DATA TYPE, you are asked the following questions:

```
Select FIELD: RELIGION
Are you adding 'RELIGION' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF RELIGION: POINTER TO A FILE
POINT TO WHICH FILE: RELIGION
```

Figure 121: Defining a POINTER TO A FILE DATA TYPE Field in Scrolling Mode (1)

The file that is pointed to must already exist on your system. If you enter a single question mark ("?") at the "POINT TO WHICH FILE:" prompt, you will be presented with a list of the available files.

```
SHOULD 'ADDING A NEW RELIGION FILE ENTRY' ("LAYGO")  
BE ALLOWED WHEN ANSWERING THE 'RELIGION' QUESTION? NO// <RET> (NO)
```

Figure 122: Defining a POINTER TO A FILE DATA TYPE Field in Scrolling Mode (2)

By answering NO to this prompt, users who are editing patient data are not able to add a new entry on the fly to the RELIGION file. This prompt depends on whether you have LAYGO access to the file or not.

```
WILL RELIGION FIELD BE MULTIPLE? NO// <RET> (NO)  
IS RELIGION ENTRY MANDATORY (Y/N): NO// <RET> NO  
....  
'HELP' -PROMPT: <RET>  
DESCRIPTION:  
  1> <RET>
```

Figure 123: Defining a POINTER TO A FILE DATA TYPE Field in Scrolling Mode (3)

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a POINTER TO A FILE DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

VARIABLE-POINTER DATA TYPE

A DATA TYPE defined as a VARIABLE-POINTER (as with the POINTER TO A FILE DATA TYPE) requires you to enter the names or numbers of the pointed-to files and those files must already exist (defined previously). Additionally, an order, message, and prefix must be associated with each file.

For example, when defining a VARIABLE-POINTER DATA TYPE, you are asked the following questions:

```
Select FIELD: PROVIDER
Are you adding 'PROVIDER' as a new FIELD? No// Y <RET> (Yes)

DATA TYPE OF PROVIDER: VARIABLE-POINTER
Select VARIABLE POINTER: PROVIDER
```

Figure 124: Defining a VARIABLE-POINTER DATA TYPE Field in Scrolling Mode (1)

You answer the "Select VARIABLE POINTER:" prompt with the name or number of an existing file.

```
Are you adding 'PROVIDER' as a new VARIABLE-POINTER? No// Y <RET> (Yes)

VARIABLE-POINTER: PROVIDER// <RET>
MESSAGE: Staff Provider
ORDER: 1
PREFIX: S
SHOULD USER BE ALLOWED TO ADD A NEW ENTRY: NO <RET> NO
```

Figure 125: Defining a VARIABLE-POINTER DATA TYPE Field in Scrolling Mode (2)

The MESSAGE is part of the online Help associated with the VARIABLE-POINTER field when a single question mark ("?") is entered during editing. In this example, the PROVIDER file MESSAGE is associated with "Staff Provider."

The several pointed-to files are searched based on their ORDER. In this example, since the ORDER for the PROVIDER VARIABLE-POINTER is one, the PROVIDER file is the first file searched.

The PREFIX field is used to reference a particular pointed-to file. To see the entries in a particular file, you would enter that file's PREFIX followed by a period and a question mark at the VARIABLE-POINTER's field name (e.g., in this example, entering "S.?" would give you the option to list the entries in the PROVIDER file). If

you want to refer to only one of the several pointed-to files, put that file's PREFIX followed by a period at the VARIABLE-POINTER's field name (e.g., in this example, entering "S." would refer you to the PROVIDER file).

By answering NO to the "SHOULD USER BE ALLOWED TO ADD A NEW ENTRY:" prompt, the user is *not* allowed to add new entries on the fly to the PROVIDER file (the same as the RELIGION field entered as a POINTER TO A FILE). If you had answered YES, then new entries could be added to the PROVIDER file.

```
Select VARIABLE-POINTER: 16 <RET> PERSON
  Are you adding 'PERSON' as a new VARIABLE-POINTER? (the 2ND)? No// Y <RET>
(Yes)
VARIABLE-POINTER:    PERSON// <RET>
MESSAGE: Other Provider
ORDER: 2
PREFIX: 0
SHOULD USER BE ALLOWED TO ADD A NEW ENTRY: YES <RET> YES
```

Figure 126: Defining a VARIABLE-POINTER DATA TYPE Field in Scrolling Mode (3)

In this example, a second VARIABLE-POINTER was created to the PERSON file (#16). By answering YES to the "SHOULD USER BE ALLOWED TO ADD A NEW ENTRY:" prompt, users who are editing patient data are allowed to add entries to the PERSON file.

```
Select VARIABLE-POINTER: <RET>
```

Figure 127: Defining a VARIABLE-POINTER DATA TYPE Field in Scrolling Mode (4)

You stop identifying files for a VARIABLE-POINTER by simply pressing the Enter/Return key without any additional entries at the "Select VARIABLE-POINTER:" prompt.

```
WILL PROVIDER FIELD BE MULTIPLE? No// <RET> (No)
IS PROVIDER ENTRY MANDATORY (Y/N): NO// <RET> NO
'HELP' -PROMPT: <RET>
DESCRIPTION:
  1> <RET>
```

Figure 128: Defining a VARIABLE-POINTER DATA TYPE Field in Scrolling Mode (5)

After entering both VARIABLE-POINTERS, when you enter a single question mark ("?.") at the "PROVIDER" field prompt, you will see the following Help message:

```

PROVIDER: ?
  Enter one of the following:
    S.EntryName to select a Staff Provider
    O.EntryName to select a Other Provider

  To see the entries in any particular file type <Prefix.?.>

```

Figure 129: An Example of Help Associated with a VARIABLE-POINTER Field

In this example, if you simply enter a name at the "PROVIDER:" prompt, then the system will search each of the VARIABLE-POINTER field files for the name you have entered.

If a match is found, the system will ask you if it is the correct entry. However, if you know the file the entry should be in, then you can speed processing by using the following syntax to select an entry:

- **PREFIX.entry name**
- **MESSAGE.entry name**
- **File Name.entry name**

You do *not* need to enter the entire file name or message to direct the lookup. Using the first few characters will suffice.

You can review and change a file's field attributes easily by running the Modify File Attributes option in Screen Mode. For an example of entering a VARIABLE-POINTER DATA TYPE in Screen Mode, please refer to the "Examples of File and Field Creation" topic that follows.

MUMPS DATA TYPE

Those with programmer access can define a field as a MUMPS DATA TYPE. This DATA TYPE is designed specifically to contain executable M code. The code entered into this kind of field is verified to be valid M code that conforms to VA programming standards.

MUMPS DATA TYPE fields are usually used in files that are part of developer tools systems. For example, the OPTION file (#19) is part of the MENU MANAGEMENT system used in the VA for assigning menus and associated actions to each computer user. The ENTRY ACTION field on the OPTION file is defined as a MUMPS type field. This field allows a developer who is creating an option to enter M code to do any setup and initialization that is needed before the end user can do the action allowed by the option.

Multiple-Valued Field (Multiples)

When you create a field of DATA TYPE: DATE/TIME, NUMERIC, SET OF CODES, FREE TEXT, POINTER TO A FILE, and VARIABLE-POINTER, after entering type-specific information, you are asked:

```
WILL FIELD BE MULTIPLE: NO//
```

Answering YES to this prompt, means that:

- There can be more than one occurrence of a data value for this field in the entry (e.g., more than one DIAGNOSIS in a PATIENT file entry)
- Subfields can later be associated with this field (e.g., each DIAGNOSIS could have a DATE OF ONSET)

The "MULTIPLE:" prompt is not asked for WORD-PROCESSING DATA TYPE fields, since, by definition, such types take Multiline values.

Two special questions are asked about Multiple-valued fields:

```
SHOULD USER SEE AN 'ADDING NEW ENTRY?' MESSAGE FOR NEW ENTRIES (Y/N)
```

Answering NO here means that the new Diagnosis (or whatever the Multiple is named) gets added without a verification prompt being asked.

```
HAVING ENTERED OR EDITED ONE, SHOULD USER BE ASKED ANOTHER (Y/N) :
```

Answering YES means that the user is prompted to put in several diagnoses, one right after the other. NO means that the user is not prompted to enter a second value.

Making a Field Mandatory

For all DATA TYPEs except COMPUTED, as you create the field, you're asked:

```
IS "xxxxxxxx" ENTRY MANDATORY (Y/N) : NO//
```

The "xxxxxxxx" represents the name of the field. If you answer YES, the user of your file will *not* be allowed to skip the field without entering data for a particular entry.

Creating Files and Fields

Field Number Sequences

It is often useful to sequence the fields so that when you are using the Enter or Edit File Entries option and you ask to edit ALL fields, you will see the field questions presented in a natural order. If you want to add a CURRENT AGE field to our PATIENT file and place it between DATE OF BIRTH (#2) and RELIGION (#3), the dialogue would be:

```
Select FIELD: 2.5
Are you adding a new FIELD: No// Y <RET> (Yes)
LABEL: CURRENT AGE
FIELD NUMBER: 2.5// <RET>
```

Figure 130: An Example of "Sequencing" a Field

You could have specified any number between two and three.

NUMBER (.001) Field

All files have unique numbers associated with each of their entries. Defining the NUMBER field allows you to use the Internal Entry Number (IEN, also called the record number) as you would any other field. Usually, this means that someone (like Herr Doktor Ludwig Koechel in the case of the MOZART WORK file) has gone to the trouble of creating a numbering scheme for the entries. If you wish to set up a file in which a unique Internal Entry Number is always matched with each entry Name, you can do so by creating a field numbered .001 for the file:

```
Select FILE: MOZART WORK
Select FIELD: .001
Are you adding a new FIELD? No// YES <RET> (Yes)
LABEL: KOECHEL NUMBER
FIELD NUMBER: .001// <RET>

DATA TYPE OF KOECHEL NUMBER: NUMERIC
INCLUSIVE LOWER BOUND: 1
INCLUSIVE UPPER BOUND: 626
IS THIS A DOLLAR AMOUNT (Y/N): NO// <RET>
MAXIMUM NUMBER OF FRACTIONAL DIGITS: 0// <RET>
HELP PROMPT: Type a Number between 1 and 626, 0 Decimal Digits.
Replace <RET>
DESCRIPTION:
1> <RET>
```

Figure 131: Creating a .001 NUMBER Field

The previous dialogue (Figure 131) is what would normally create a NUMERIC-valued field. In this case, we are describing the file's PRIMARY KEY, or Internal Entry Number.

Once such a .001 field is defined, you can create a new file entry that might look like this:

```
Select MOZART WORK: EINE KLEINE NACHTMUSIK
Are you adding a new MOZART WORK? No// YES <RET> (Yes)
KOECHER NUMBER: 525
```

Figure 132: An Example of Creating a New File Entry with a .001 Field Defined

More importantly, with a .001 field defined, an entry in the file can always be looked up by the Internal Entry Number (IEN), irrespective of any other cross-referencing that exists for the file. Thus:

```
Select MOZART WORK: 525 <RET> EINE KLEINE NACHTMUSIK
```

Figure 133: Looking Up an Entry in a File Using the IEN

Record Numbers must always be positive and canonic—that is, they *cannot* contain alpha suffixes, leading zeros, or trailing fractional zeros.

Forced Lookups Using Numbers

Number-meaningful lookups can be forced by prefixing the numeric input with the ‘ (accent grave). If Richard Green's Internal Entry Number in the PATIENT file is 355, he could be identified as follows:

```
Select PATIENT NAME: `355 <RET> GREEN,RICHARD
```

Incidentally, the .001 field example (above) illustrates how using the Modify File Attributes option can force a field to have a particular number (.001 in this case). It is done just by entering the new Number first, and then the new Label.

Changing and Deleting Fields

- Changing Field Attributes
- Changing a Field's DATA TYPE
- Deleting a Field

Changing Field Attributes

After creating a field in a file, you can return to **change** or **delete** the field within the Modify File Attributes option, simply by entering the field name (or number) when asked:

```
Select FIELD:
```

When you return to the field in this option, you are able to change a field's:

- Label (Name)
- Title (long form of its name)
- Audit and Audit Conditions (to indicate which fields should be audited)
- Read/Delete/Write
- Source
- Destination
- Group
- Description of the field, a WORD-PROCESSING field (what the user sees after entering two question marks)
- Technical Description

After you are presented with these attributes of the field, you can change the attributes defined during the initial definition of the field as illustrated in the "Creating Fields" topic above.

For example, let's say you have created an SSN field (Social Security Number) in the PATIENT file and would now like to edit the field:

```
Select FIELD: SSN
LABEL: SSN// <RET>
TITLE: Social Security Number
AUDIT: YES, ALWAYS
AUDIT CONDITION: <RET>
```

Figure 134: Editing a Field—LABEL, TITLE, and AUDIT Attributes

Auditing is described in the "Auditing" chapter in this manual.

```
READ ACCESS (OPTIONAL): <RET>
DELETE ACCESS (OPTIONAL): <RET>
WRITE ACCESS (OPTIONAL): <RET>
```

Figure 135: Editing a Field—ACCESS Privileges Attributes

Control of various kinds of access to files is described in the "Data Security" chapter in this manual.

```
SOURCE: <RET>
Select DESTINATION: <RET>
Select GROUP: DEMOG
```

Figure 136: Editing a Field—SOURCE, DESTINATION, GROUP Attributes

A GROUP is a shorthand way for the user to refer to several fields at once when using the Print File Entries or the Enter or Edit File Entries options. Here, SSN is being assigned to the DEMOG group.

```

DESCRIPTION:
1>An entry is required.  If you do not know this patient's Social
2>Security Number, enter '000000000' to indicate the number is
3>unknown.
EDIT Option: <RET>
TECHNICAL DESCRIPTION:
1> <RET>

```

Figure 137: Editing a Field—DESCRIPTION Attributes

The DESCRIPTION and TECHNICAL DESCRIPTION attributes document the use and meaning of the field. The information in DESCRIPTION is shown to the user when two question marks are entered at the "EDIT Option:" prompt. When initially creating a field, you are prompted for the DESCRIPTION field after the 'HELP'-PROMPT. The TECHNICAL DESCRIPTION is displayed only when the data dictionary is printed.

Versions of VA FileMan prior to Version 21.0 allowed you to also enter a Help Frame for field documentation; that attribute is no longer supported.

```

DATA TYPE OF SSN:  FREE TEXT// <RET>
MINIMUM LENGTH:  9// <RET>
MAXIMUM LENGTH:  9// <RET>
(OPTIONAL) PATTERN MATCH (IN 'X'): X?9N// <RET>
IS SSN ENTRY MANDATORY (Y/N): Y// <RET>
'HELP'-PROMPT:  ANSWER MUST BE 9 CHARACTERS IN LENGTH
  Replace ... With  Enter 9 numbers without dashes, e.g., 123456789.
  Replace <RET>
    Enter 9 numbers without dashes, e.g., 123456789.

```

Figure 138: Editing a Field—DATA TYPE, LENGTH, PATTERN MATCH, MANDATORY 'HELP' PROMPT Attributes

To illustrate the use of GROUPs, add the NAME, DATE OF BIRTH, and SEX fields into the DEMOG group:

```
Select FIELD: NAME
LABEL: NAME// ^GROUP
Select GROUP: DEMOG
DESCRIPTION:
1> <RET>
TECHNICAL DESCRIPTION:
1> <RET>

DATA TYPE OF NAME: FREE TEXT// ^
```

Figure 139: Adding Fields to a GROUP (1)

DATE OF BIRTH and SEX can be added to the GROUP in the same way. Now, when using the Enter or Edit File Entries option, you could say:

```
EDIT WHICH FIELD: DEMOG
1 DEMOG NAME
2 DEMOG SEX
3 DEMOG DATE OF BIRTH
EDIT WHICH FIELD: <RET>

Select PATIENT NAME: GREEN,RICHARD
NAME: GREEN,RICHARD// <RET>
SEX: MALE// <RET>
DATE OF BIRTH: JAN 3, 1955// <RET>
```

Figure 140: Adding Fields to a GROUP (2)

Changing a Field's DATA TYPE

Within the Modify File Attributes option, you can change the DATA TYPE itself. There are limitations on the sort of changes you can make. These are listed below.

You must be very careful in making such changes if you already have file data entered, because there is no guarantee that the old data will match the newly specified criteria (e.g., field length). However, if you do change a field definition, you are asked if you want existing data checked for inconsistencies. A list of any discrepancies is printed. If more than one discrepancy is found, you can save the list of discrepant entries in a template. To generate this list later, use the Verify Fields option on the Utility Functions submenu.

The following restrictions apply to changing the definitions of existing data fields in a file:

- Multiple-valued fields cannot be changed to single-valued fields or vice versa. Multiple-valued fields can only be defined when creating a field.
- COMPUTED fields cannot be changed to other types of fields or vice versa.
- WORD-PROCESSING-type fields should only be changed into Multiple-valued FREE TEXT fields.
- Only a Multiple-valued FREE TEXT field can be changed into a WORD-PROCESSING field, and only if no other subfields are defined for that field.
- POINTER TO A FILE DATA TYPEs cannot be changed to VARIABLE-POINTER types or vice versa.

Deleting an Existing Field

Deleting a field and its definition is done by deleting the field Name (LABEL). Delete the field by typing the at-sign ("@") after the display of a field's LABEL when using the Modify File Attributes option:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// NO <RET> (No)

MODIFY WHAT FILE: PATIENT

Select FIELD: SEX
LABEL: SEX// @
      SURE YOU WANT TO DELETE THE ENTIRE 'SEX' FIELD? YES
OK TO DELETE 'SEX' FIELDS IN THE EXISTING ENTRIES? YES
```

Figure 141: Deleting a Field and its Definition

If you answer NO to the "OK TO DELETE" question, data conflicts may occur in the future, if you create new fields. It is advisable to always delete existing entries. Only a programmer can delete the entries after you have answered NO.

Creating Files and Fields

Examples of File and Field Creation

The following examples of creating files/fields or editing fields in a file are illustrated using Screen Mode.

- File Creation
- DATE/TIME Field
- SET OF CODES Field
- FREE TEXT Field
- WORD-PROCESSING Field
- COMPUTED Field
- POINTER TO A FILE Field
- VARIABLE-POINTER Field
- Creating a Multiple
- Subfields
- NUMERIC Subfield

These examples assume that the user does *not* have programmer access. For explanations of additional capabilities available to the programmer, please refer to the "Advanced File Definition" chapter in the *VA FileMan Programmer Manual*.

File Creation

The following example illustrates the file definition dialogue you see when creating a new file using the Modify File Attributes option. In this case, we will create the ORDER file (#100, a standard VA FileMan file):

```

Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER
  Are you adding 'ORDER' as a new FILE? No// Y <RET> (Yes)
  FILE NUMBER: 99000// 100

...SORRY, HOLD ON...
  A FreeText NAME Field (#.01) has been created.

Select FIELD: NAME
    
```

Figure 142: Using the Modify File Attributes Option to Create a File

VA FileMan prompts you to enter the file name. If it is a new file, VA FileMan will ask you to confirm that you want to add a new file. The default file number to the left of the "/" (e.g., 99000) is related to a site number that is assigned to your computer when VA FileMan is initialized. This file number is within the range of numbers assigned to your site. Be sure to follow local policies when assigning file numbers.

As you can see from this example, when a file is created a field with the label NAME and number .01 is automatically created. When creating a new file, you can change the definition of this field in the same way you can change the definition of any other field.

When you select a field (e.g., the NAME field), you will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```

Field #.01 in File #100
FIELD LABEL: NAME          DATA TYPE... FREE TEXT
TITLE:
AUDIT:
AUDIT CONDITION:
  READ ACCESS:
  DELETE ACCESS:
  WRITE ACCESS:
SOURCE:
DESCRIPTION...           TECHNICAL DESCRIPTION...
IS THIS FIELD MULTIPLE... NO
MANDATORY: YES
HELP-PROMPT: NAME MUST BE 3-30 CHARACTERS, NOT NUMERIC OR STARTING WITH PU
EXECUTABLE HELP:
COMMAND:                Press <FF1>H for help  Insert

```

Figure 143: Defining the .01 NAME Field in Screen Mode

DATE/TIME Field

In the following example, the DATA TYPE field for the RELEASE DATE/TIME field (#.68) in the ORDER file (#100) has a value of DATE/TIME:

```

Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: RELEASE DATE/TIME

```

Figure 144: Using the Modify File Attributes Option to Edit a DATE/TIME Field in Screen Mode

Creating Files and Fields

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```
Field #.68 in File #100
FIELD LABEL: RELEASE DATE/TIME          DATA TYPE... DATE
AU
D
    EARLIEST DATE: [REDACTED]
    LATEST DATE:
    CAN DATE BE IMPRECISE: NO
    CAN TIME OF DAY BE ENTERED: YES
    CAN SECONDS BE ENTERED: YES
    IS TIME REQUIRED: YES
    IS THIS FIELD MULTIPLE... NO
    MANDATORY: NO
    HELP-PROMPT: Enter the Date/time this order was released to the service.
    EXECUTABLE HELP:
COMMAND:                               Press <PF1>H for help  Insert
```

Figure 145: Defining a DATE/TIME DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. DATE/TIME-type fields don't have any required entries. You can accept all the default values within the "pop-up" window, simply by closing the window by pressing the "F1-C" keys.

To delete the entire field, enter an at-sign ("@") at the "FIELD LABEL:" prompt.

SET OF CODES Field

In the following example, the DATA TYPE field for the FLAGGED field (#.61) in the ORDER file (#100) has a value of SET OF CODES:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: FLAGGED
```

Figure 146: Using the Modify File Attributes Option to Edit a SET OF CODES Field in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

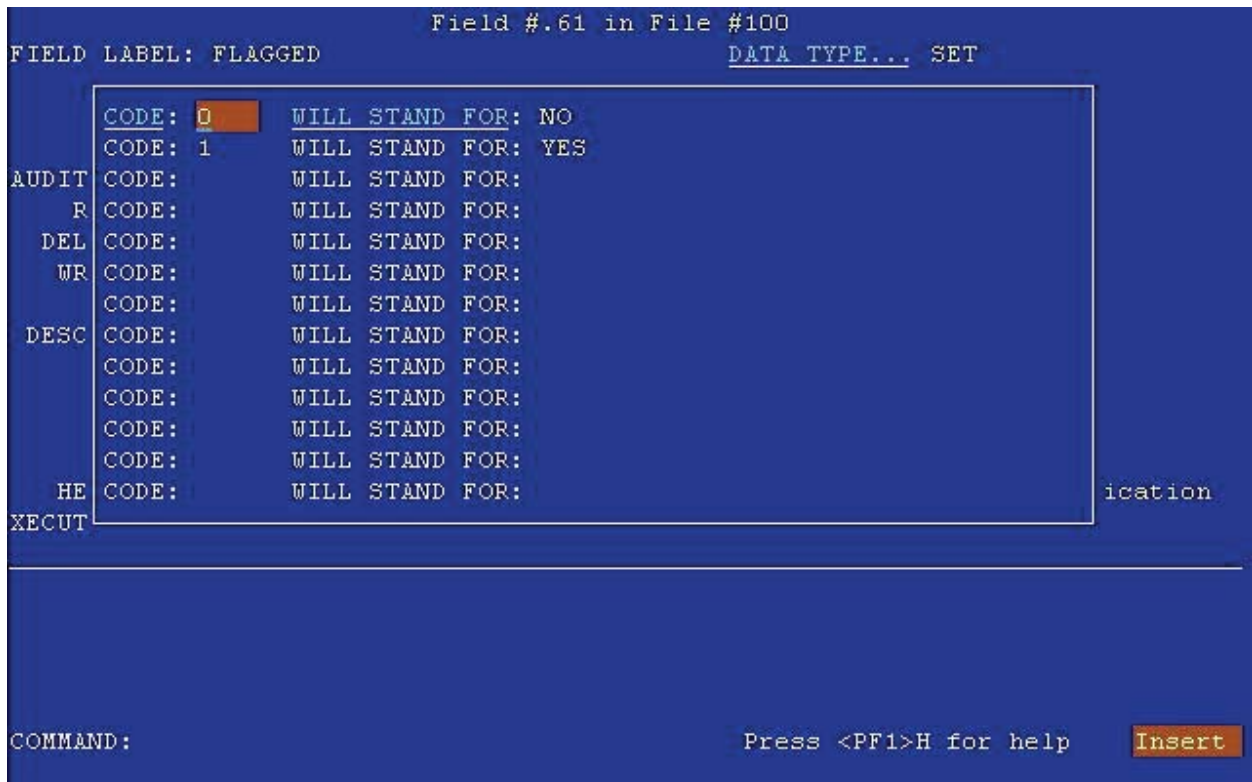

Figure 147: Defining a SET OF CODES DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. SET OF CODES-type fields require input of all the allowable "Internal" values (i.e., "CODE" prompt), and their "External" equivalents (i.e., "WILL STAND FOR" prompt).

Using the <ArrowUp> and <ArrowDown> keys makes it easy to edit the codes. It is permissible to leave a blank row, but every Internal Code (i.e., "CODE," on the left) must have a corresponding External Code ("WILL STAND FOR," on the right), and vice versa.

FREE TEXT Field

In the following example, the DATA TYPE field for the REASON FOR FLAG field (#.67) in the ORDER file (#100) has a value of FREE TEXT:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: REASON FOR FLAG
```

Figure 148: Using the Modify File Attributes Option to Edit a FREE TEXT Field in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```

Field #.67 in File #100
FIELD LABEL: REASON FOR FLAG          DATA TYPE... FREE TEXT
  MINIMUM LENGTH: 1
  MAXIMUM LENGTH: 80
AUDIT C PATTERN MATCH (IN 'X'): X'?1P.E
  REA
DELETE ACCESS:
WRITE ACCESS:
SOURCE:
DESCRIPTION...      TECHNICAL DESCRIPTION...
IS THIS FIELD MULTIPLE... NO
MANDATORY: NO
HELP-PROMPT: Enter the reason for the flag
EXECUTABLE HELP:
COMMAND:                Press <PF1>H for help  Insert

```

Figure 149: Defining a FREE TEXT DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. FREE TEXT-type fields require input for the "MINIMUM" and "MAXIMUM" lengths of the field. In this example, users must enter from 1 to 80 characters for this field.

If included, the PATTERN MATCH must be written in M. For example, you can insure that the data value will not start with a punctuation character by entering a PATTERN MATCH of "X'?1P.E". This is a good check to make on a field that is allowed to be just one character in length. Sometimes, users may mistype and answer a field prompt with "/" (same key as "?") or some other meaningless punctuation character. A PATTERN MATCH check such as "X'?1P.E" will keep that kind of mistake out of your database.

WORD-PROCESSING Field

In the following example, the DATA TYPE field for the ORDER TEXT field (#.11) in the ORDER file (#100) has a value of WORD-PROCESSING:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: ORDER TEXT
```

Figure 150: Using the Modify File Attributes Option to Edit a WORD-PROCESSING Field in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

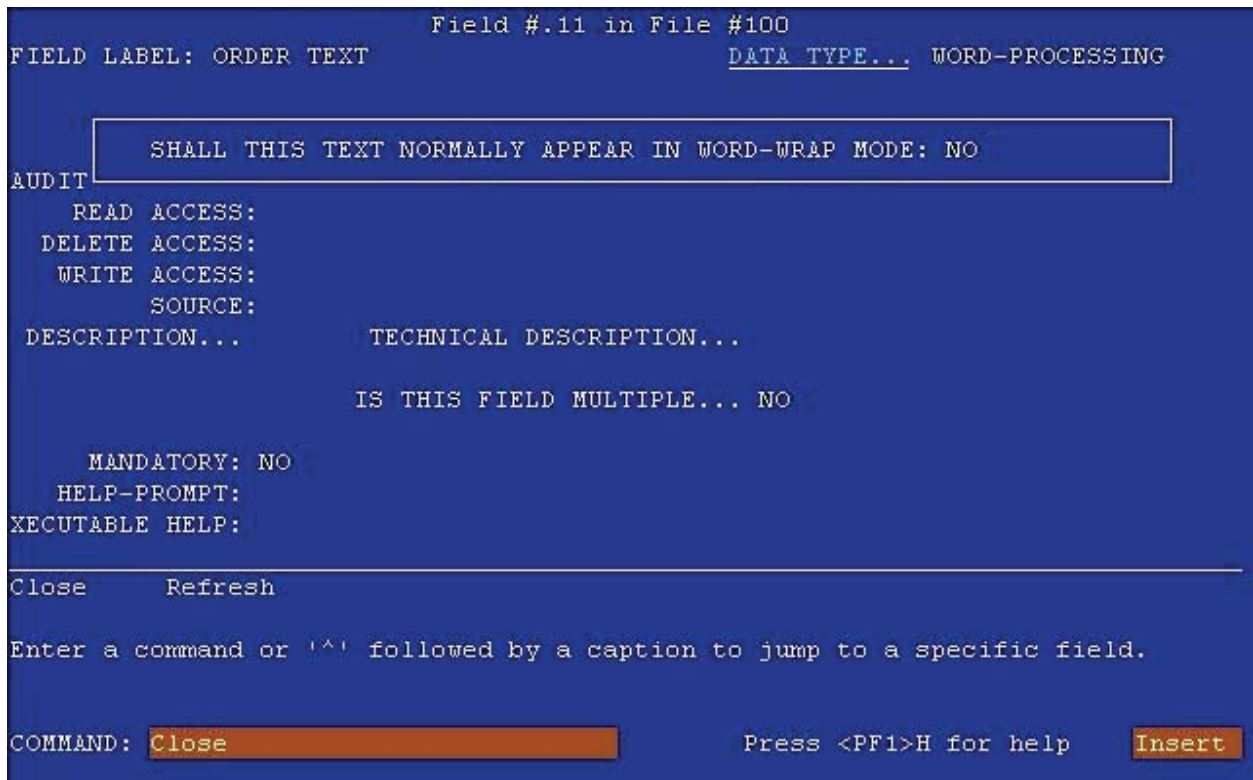

Figure 151: Defining a WORD-PROCESSING DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. With WORD-PROCESSING-type fields VA FileMan asks only one question in the "pop-up" window (i.e., "SHALL THIS TEXT NORMALLY APPEAR IN WORD-WRAP MODE"). If you answer YES to this question, text is automatically wrapped at word boundaries to fit in the column in which it is being printed.

Here's a tip—When it is important that lines of text be printed exactly as they were entered, answer NO to the "SHALL THIS TEXT NORMALLY APPEAR IN WORD-WRAP MODE" question.

COMPUTED Field

In the following example, the DATA TYPE field for the JUST RELEASED field (#1000) in the ORDER file (#100) has a value of COMPUTED:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: JUST RELEASED
```

Figure 152: Using the Modify File Attributes Option to Edit a COMPUTED Field in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```
Field #1000 in File #100
FIELD LABEL: JUST RELEASED          DATA TYPE... COMPUTED

COMPUTED-FIELD EXPRESSION:
#.68+2>TODAY
A      TYPE OF RESULT: BOOLEAN
      NUMBER OF FRACTIONAL DIGITS TO OUTPUT:
      SHOULD VALUE ALWAYS BE ROUNDED:
WHEN TALLING, SHOULD SUMS BE SUMS OF COMPONENT FIELDS:
      LENGTH OF FIELD: 3

IS THIS FIELD MULTIPLE... NO

MANDATORY: NO
HELP-PROMPT:
EXECUTABLE HELP:

COMMAND:                               Press <PF1>H for help  Insert
```

Figure 153: Defining a COMPUTED DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. With COMPUTED-type fields VA FileMan displays the characteristics of the computed expression in the "pop-up" window.

The syntax of these expressions is explained fully in the "Computed Expressions" chapter in this manual.

Field #.68 is the RELEASE DATE/TIME field. The JUST RELEASED field will be TRUE if the RELEASE DATE/TIME was less than two days ago.

We can specify this virtual value to be **BOOLEAN**, **STRING-VALUED**, **DATE-VALUED**, or **NUMERIC**. Only in the last case are the three fields following the "TYPE OF RESULT" prompt editable.

POINTER TO A FILE Field

In the following example, the **DATA TYPE** field for the **WHO ENTERED** field (#3) in the **ORDER** file (#100) has a value of **POINTER TO A FILE**:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: WHO ENTERED
```

Figure 154: Using the Modify File Attributes Option to Edit a POINTER TO A FILE Field in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

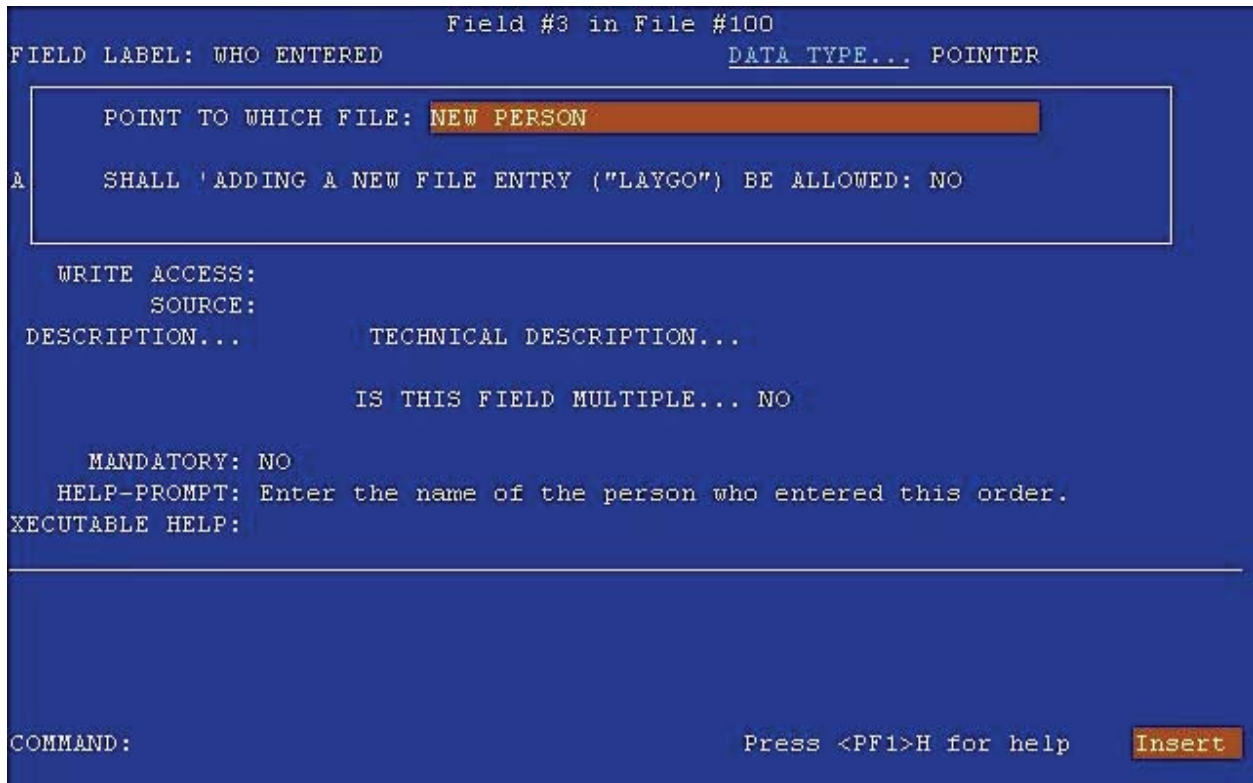

Figure 155: Defining a POINTER TO A FILE DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. With POINTER TO A FILE-type fields VA FileMan asks you to enter the pointed-to file name in the "pop-up" window. The file that is pointed to (in this case, the NEW PERSON file) must already exist on your system. If you enter a ? (single question mark) at this prompt, you will be presented with a list of the available files from which you can choose.

By answering NO to the "LAYGO" question, you insure that users who are editing the "WHO ENTERED" data are not able to add a new entry on the fly to the NEW PERSON file.

VARIABLE-POINTER Field

In the following example, the DATA TYPE field for the ITEM ORDERED field (#7) in the ORDER file (#100) has a value of VARIABLE-POINTER:

```

Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: ITEM ORDERED
    
```

Figure 156: Using the Modify File Attributes Option to Edit a VARIABLE-POINTER Field in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```

Field #7 in File #100
FIELD LABEL: ITEM ORDERED          DATA TYPE... VARIABLE-POINTER
-----
VARIABLE-POINTER FILE #1: OPTION          ORDER... 1
VARIABLE-POINTER FILE #2: LAB TEST       ORDER... 2
AU VARIABLE-POINTER FILE #3:              ORDER...
VARIABLE-POINTER FILE #4:              ORDER...
VARIABLE-POINTER FILE #5:              ORDER...
VARIABLE-POINTER FILE #6:              ORDER...
-----
D          VARIABLE-POINTER #1
MESSAGE: PROTOCOL
PREFIX: MISC
SHOULD USER BE ALLOWED TO ADD A NEW ENTRY: NO
SCREEN:
EXPLANATION OF SCREEN:
-----
XE
COMMAND:                               Press <PF1>H for help Insert
    
```

Figure 157: Defining a VARIABLE-POINTER DATA TYPE Field in Screen Mode

In Screen Mode, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. With VARIABLE-POINTER-type fields VA FileMan asks you to enter the pointed-to file name and its order in the first "pop-up" window. In this case, the first VARIABLE-POINTER file entered was the OPTION file, which would already have to exist. The ORDER was also set to one. When you press the Enter/Return key at the "ORDER" prompt for each VARIABLE-POINTER, there is an additional "pop-up" window (i.e., a "pop-up window within the pop-up window"). The additional questions pertaining to the VARIABLE-POINTER file you are currently entering will appear in this secondary "pop-up" window.

As you can see in this example, the OPTION file's MESSAGE, is associated with "PROTOCOL." Since its ORDER is one, it is the first file searched. The PREFIX "MISC" can also be used to refer to the OPTION file. Just as with the WHO ENTERED POINTER TO A FILE field (previously described), users cannot add new options to the OPTION file on the fly when they are entering an ITEM ORDERED in the ORDER file because the "SHOULD USER BE ALLOWED TO ADD A NEW ENTRY:" prompt is NO.

Creating a Multiple

The following example illustrates creating a Multiple field. For this example, we will simulate creating the RESPONSES field (#4.5) in the ORDER file (#100). It has a DATA TYPE of NUMERIC:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: RESPONSES
Are you adding 'RESPONSES' as a new FIELD? No// Y <RET> (Yes)
FIELD NUMBER: 4.5// <RET>
```

Figure 158: Using the Modify File Attributes Option to Create a Multiple in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```

Field #4.5 in File #100
FIELD LABEL: RESPONSES          DATA TYPE... NUMERIC
    TITLE:
    AUDIT:
AUDIT CONDITION:
    READ ACCESS:
    DELETE ACCESS:
    WRITE ACCESS:
    SOURCE:
DESCRIPTION...      TECHNICAL DESCRIPTION...

                IS THIS FIELD MULTIPLE... YES

SHOULD USER SEE AN "ADDING A NEW ENTRY" MESSAGE: NO
HAVING ENTERED OR EDITED ONE MULTIPLE, SHOULD USER BE ASKED ANOTHER: NO

COMMAND:                Press <PF1>H for help      Insert

```

Figure 159: Defining a NUMERIC Multiple DATA TYPE Field in Screen Mode

A Multiple field is created just as any other, except that the "IS THIS FIELD MULTIPLE..." question is answered YES. In Screen Mode, after answering YES to this question, a "pop-up" window appears containing editable attributes pertinent to a Multiple field. With Multiple-type fields, VA FileMan asks if you want users to be notified when they are adding new entries and if users should be asked if they want to make another entry. In this case, we answered NO to both questions.

SUBFIELDS

To create or edit Subfields of a Multiple field, select a Multiple-valued field (e.g., the RESPONSES Multiple field, previously created):

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USE THE SCREEN-MODE VERSION? Yes// <RET> (Yes)

MODIFY WHAT FILE: ORDER// <RET>

Select FIELD: RESPONSES (multiple)
```

Figure 160: Using the Modify File Attributes Option to Edit a Multiple's Subfield in Screen Mode

You will then be taken into a ScreenMan form where you can edit the properties of the field, as shown below:

```
Multiple Field #4.5 in File #100

MULTIPLE-FIELD LABEL: RESPONSES
  READ ACCESS:
  WRITE ACCESS:
  SOURCE:

COMMAND: Press <PF1>H for help Insert
```

Figure 161: Reviewing/Editing the Properties of a Multiple DATA TYPE Field in Screen Mode

In Screen Mode, after entering a Multiple field, a special screen appears that displays information about the Multiple *as a whole*.

If you wanted to delete *the entire Multiple field*, you would enter an at-sign ("@") at the "MULTIPLE-FIELD LABEL" prompt.

After viewing this screen, you can proceed to add fields to the Multiple or to edit existing Subfields. This is done at the "Select SUB-FIELD:" prompt that is displayed when you exit Screen Mode (shown below).

NUMERIC SUBFIELD

After selecting a Multiple-valued field (e.g., the RESPONSES Multiple field in the ORDER file), you can enter or modify the Multiple's subfields by entering the field's number or name (label) at the "Select xxxxxxxx SUB-FIELD:" prompt (where xxxxxxxx represents the name of the Multiple).

A .01 field with the same name as the Multiple field was added automatically when the field was identified as a Multiple. The .01 field is the identifying key for an entry in the Subfile (Multiple); it is similar to a file's .01 field, which is the file's identifying key. In the following example, the .01 subfield is edited to have a DATA TYPE of NUMERIC:

```
Select RESPONSES SUB-FIELD: .01 <RET> ITEM ENTRY
```

Figure 162: An Example of a .01 Subfield of a Multiple

You will then be taken into a ScreenMan form where you can edit the properties of the subfield, as shown below:

```

Field #.01 in Sub-File #100.045 of File #100
FIELD LABEL: ITEM ENTRY          DATA TYPE... NUMERIC
AU
    INCLUSIVE LOWER BOUND: 1
    INCLUSIVE UPPER BOUND: 9999999
    IS THIS A DOLLAR AMOUNT: NO
    MAXIMUM NUMBER OF FRACTIONAL DIGITS: 0
SOURCE:
DESCRIPTION...          TECHNICAL DESCRIPTION...
IS THIS FIELD MULTIPLE... YES
MANDATORY: NO
HELP-PROMPT: Type a Number between 1 and 9999999, 0 Decimal Digits
EXECUTABLE HELP:
COMMAND:                Press <PF1>H for help  Insert
  
```

Figure 163: Defining a NUMERIC DATA TYPE Subfield in Screen Mode

In Screen Mode, while editing a sub-field of a Multiple, you will notice that the heading at the top of the screen reminds you that you are now editing a field *within a Multiple* (e.g., "Field #.01 in Sub-File #100.045 of File #100").

Also, whenever the DATA TYPE field is editable, a "pop-up" window appears, containing editable attributes of the field that are pertinent to its specific DATA TYPE. With NUMERIC-type fields VA FileMan asks you to enter the "INCLUSIVE LOWER BOUND" (e.g., set to 1) and the "INCLUSIVE UPPER BOUND" (e.g., set to 9999999). In addition, you are asked if the numeric value is a dollar amount and if decimal digits will be allowed (i.e., the "MAXIMUM NUMBER OF FRACTIONAL DIGITS").

A default Help prompt is automatically written for you with the NUMERIC DATA TYPE. In this case, the English message "Type a Number between 1 and 9999999, 0 Decimal Digits" has been built automatically from the specifications. As always, you can accept the default Help prompt or change it using the Replace ... With syntax.

This Help information is displayed when the user inputs a single question mark ("?",) when editing this field.

Creating Files and Fields

10. File Utilities

Various file utilities are provided as options on VA FileMan's Utility Functions submenu.

Some additional functionality for modifying files is contained in the separate Modify File Attributes option, which is on the main VA FileMan menu.

Verify Fields

The Verify Fields option uses a field's definition to verify the data stored in a file. After invoking this option, you can ask to verify all existing values of a particular field by entering its label at the "VERIFY WHICH FIELD:" prompt; or you can ask that all fields at a given file level be verified by entering ALL at the prompt.

If more than one discrepancy is found between the current definition and the data on file, you will be asked if you want to save the list of those entries containing the inconsistent data in a template. Later you would be able to "SORT BY:" the entries in this template to display or edit them.

For information on how to execute or avoid executing any part of the INPUT transform when the Verify Fields option is being run, please refer to the "Input Transform" section in the "Advanced File Definition" chapter in the VA FileMan Programmer Manual. Some parts of a field's INPUT transform (whose main purpose is to validate data as a user enters it) may be inappropriate when being executed in the context of the Verify Fields option.

Cross-Reference a Field or File

- **Traditional Cross-references:**
 - Types of Traditional Cross-references
 - Edit a Traditional Cross-reference
 - Create a Traditional Cross-reference
 - Delete a Traditional Cross-reference

- **New-Style Cross-references:**
 - Edit a New-Style Cross-reference
 - Create a New-Style Cross-reference
 - Delete a New-Style Cross-reference

There are seven types of Traditional cross-references and two types of New-Style cross-references available. Generally, a cross-reference in VA FileMan specifies that some action is performed when the field's value is entered, changed, or deleted. For several types of cross-references, the action consists of putting the value into a list—an index used when looking up an entry or when sorting. The regular cross-reference is used for sorting and for lookup; you can limit it to sorting only. The KWIC, mnemonic, and SOUNDEX cross-references are also used for lookup.

You can sort a file on any field (except a WORD-PROCESSING-type field) whether or not a cross-reference exists for the field. However, sorting is done more quickly and efficiently if a regular cross-reference exists on the field.

When a file is created, a Traditional cross-reference on the NAME (#.01) field is automatically established. You can add or delete cross-references at any time using the Cross-Reference a Field or File option of the Utility Functions submenu. This option can also be used to enter a description of a cross-reference and to prevent the cross-reference from being deleted.

You can create a cross-reference on a Multiple field, a Multiple's subfields, or on any other field type except a WORD-PROCESSING-type field. For example, the PATIENT file contains the AGE AT ONSET subfield in the DIAGNOSIS Multiple. If you create a regular cross-reference for a field in a Multiple, you can choose in what context the cross-reference will be used. You might want to cross-reference the whole file by AGE AT ONSET (so that a report sorted by AGE AT ONSET could be produced efficiently). Alternately, you might want to cross-reference only an individual patient's diagnoses by onset age (so that a lookup of diagnosis could be done using AGE AT ONSET).

Types of Traditional Cross-references

Cross-reference	Description
REGULAR	The field value is sorted and stored in the cross-reference. The regular cross-reference is used for sorting. If you wish, it will be used when looking up entries also. The cross-reference that is automatically created on the NAME field (#.01 field) when a file is created is a regular cross-reference; this is the "B" cross-reference.
KWIC	<p>Key Word in Context—each word of three or more letters in the field value becomes a separate cross-reference. A space is considered the primary word separator. For example, KING LEAR can be looked up under either KING or LEAR.</p> <p>Uppercase or lowercase two letter words such as IN, AN, OR, and IS are <i>not</i> considered key text. The words THE, AND, THEN, FOR, FROM, OTHER, THAN, WITH, THEIR, SOME, and THIS (upper- or lowercase) are <i>not</i> considered key text. Quotation marks are also <i>not</i> considered key text.</p> <p>You can also specify that KWIC separates words at most punctuation marks except quotation marks (e.g., KING-LEAR , KING/LEAR, etc., will be found with LEAR). A list of punctuation marks is presented for your selection.</p>
MNEMONIC	The field's values are cross-referenced along with the NAME (#.01) field cross-reference (so that, for example, the MAIDEN NAME field's values are found along with NAME values in any lookup). Typically, the cross-reference on the NAME field is searched first when doing a lookup.

Table 23: Traditional Cross-references

Table 23 (continued):

Cross-reference	Description
MUMPS	Those with programmer access can create special cross-references by putting M code into the SET and KILL logic of a cross-reference. You can use the M code entered to accomplish any task that must be done when the value in a field is entered, changed, or deleted.
SOUNDEX	The field's value is transformed into a four-character string representing its phonetic properties. That string becomes the cross-reference. For example, soundex transformation would access GONZALEZ, GONZELES, Gonzales, and Gonsalles as equivalents; entry of any one of these forms looks up all the others automatically.
TRIGGER	<p>Whenever the field is updated, a different field can be automatically updated at the same time.</p> <p> For more details, please refer to the "Trigger Cross-References" chapter of the <i>VA FileMan Programmer Manual</i>.</p>
BULLETIN	Whenever a field is updated, a MailMan message is sent notifying specified users that an update has occurred. The Bulletin cross-reference is only available when VA FileMan is installed with MailMan.

Table 23: Traditional Cross-references (continued)

Edit a Traditional Cross-reference

To edit a Traditional cross-reference, identify the field or subfield you wish to edit. VA FileMan will display the type of cross-references on the field and offer you the choices of Edit, Delete, or Create. Select Edit at this prompt and you will have the opportunity to edit or add a No Deletion message and to enter a description of the cross-reference.

```
Select OPTION: UTILITY FUNCTIONS
Select Utility Functions Option: CROSS-REFERENCE A FIELD OR FILE

What type of cross-reference (Traditional or New)? Traditional// <RET>

MODIFY WHAT FILE: TEST

Select FIELD: .01 <RET> NAME

CURRENT CROSS-REFERENCE IS REGULAR 'B' INDEX OF FILE

Choose E (Edit)/D (Delete)/C (Create): E

NO DELETION MESSAGE: NO, DON'T DELETE THIS X-REF!
```

Figure 164: Editing a Traditional Cross-reference (1)

This FREE TEXT message indicates that the cross-reference *cannot* be deleted. As long as a message is retained, the cross-reference cannot be deleted. The user will see this message whenever an attempt is made to delete the cross-reference.

```
DESCRIPTION:
1>Used for look-up on and sorting by name.
2><RET>
```

Figure 165: Editing a Traditional Cross-reference (2)

The description appears in a standard DD listing.

Here's a tip—It is important to describe cross-references that are unusual or especially critical. Consider describing all MUMPS, trigger, and bulletin cross-references.

Create a Traditional Cross-reference

If you'd like to create a Traditional cross-reference for a field, proceed in the following manner:

```

Select OPTION: UTILITY FUNCTIONS
Select Utility Functions Option: CROSS-REFERENCE A FIELD OR FILE

What type of cross-reference (Traditional or New)? Traditional// <RET>

MODIFY WHAT FILE: TEST

Select FIELD: 1 <RET>  DATE

NO CURRENT CROSS-REFERENCE
WANT TO CREATE A NEW CROSS-REFERENCE FOR THIS FIELD?  NO// YES

CROSS-REFERENCE NUMBER:  1// <RET>

Select TYPE OF INDEXING:  REGULAR// <RET>
WANT CROSS-REFERENCE TO BE USED FOR LOOKUP AS WELL AS FOR SORTING?
  YES// <RET>

NO DELETION MESSAGE: <RET>
DESCRIPTION:
1>Lookup and sorting can be done by date using this Regular
2>cross-reference.
3><RET>

```

Figure 166: Creating a Traditional Cross-reference

Delete a Traditional Cross-reference

The following dialogue shows how to delete a Traditional cross-reference:

```

Select OPTION: UTILITY FUNCTIONS
Select Utility Functions Option: CROSS-REFERENCE A FIELD OR FILE

What type of cross-reference (Traditional or New)? Traditional// <RET>

MODIFY WHAT FILE: TEST

Select FIELD: 1 <RET>  DATE

CURRENT CROSS-REFERENCE IS REGULAR 'C' INDEX OF FILE

Choose E (Edit)/D (Delete)/C (Create): D
Are you sure that you want to delete the CROSS-REFERENCE? NO// YES <RET>  ...OK

```

Figure 167: Deleting a Traditional Cross-reference

New-Style Cross-references

Two types of New-Style cross-references are available: Regular and MUMPS. They are like their Traditional cross-reference counterparts, but New-Style cross-references offer some unique advantages:

- **Compound Cross-references**—You can create not only *simple cross-references* that are based on a single field, but *compound cross-references*, cross-references that are based on more than one field in a file. For example, in a regular New-Style "C" index you can store both the Name and ID Number of a record as subscripts in a single index:

```
^DIZ(1000,"C","DOE,JANE","A56789",14) =
^DIZ(1000,"C","SMITH,JOHN","D1234",5) =
```

In order to create this kind of index with a Traditional cross-reference, you would have to create two MUMPS-type cross-references, one on the NAME field and one on the ID Number field. New-Style cross-references allow you to define this compound cross-reference once as a regular index that VA FileMan can use for lookup and sorting.

- **Field- or Record-Level Execution**—Since a Traditional cross-reference is defined on a particular field, the action associated with that cross-reference is performed whenever the field is edited. With New-Style cross-references, you can specify that the action associated with a cross-reference be performed only once after the entire record has been edited, typically at the end of the editing session. Record-level execution would normally be selected for compound cross-references.

If the "C" index in the example above were defined using Traditional MUMPS-type cross-references, and both the NAME and ID Number fields were contained in a single INPUT template, the index would be updated when the NAME field was edited, and then again when the ID Number was edited. But if the cross-reference were defined as a New-Style compound index with record-level execution, the index would be updated only once after the entire record was edited, after changes to both the NAME and ID Number fields had been completed.

- **Code to Kill the Entire Index**—This is code that VA FileMan can execute to remove an entire index from a file. This can make re-indexing a file much more efficient. To delete an index, VA FileMan can execute the *Kill Entire Index Code*, instead of looping through all the record in a file and removing each record's index one at a time.

- **Activity**—New-Style cross-references can have an Activity of "R" and/or "I" to allow you to control whether the cross-reference should be fired during Reindexing and/or Installation (KIDS). If you call IX^DIK, IX1^DIK, or IXALL^DIK or if you select the Re-Index File option on VA FileMan's Utility Functions submenu to re-index all cross-references, only those New-Style cross-references that contain an "R" in Activity will be fired.

If you explicitly select a cross-reference in an EN^DIK, EN1^DIK, or ENALL^DIK call or in the Re-Index File option on VA FileMan's Utility Functions submenu, that cross-reference is fired regardless of its Activity. Also, when a field is edited, VA FileMan ignores Activity and fires all cross-references on that field, though you can control whether a cross-reference is fired by entering Set and Kill Conditions.

- **Collation**—You can specify forwards or backwards collation, the direction in which VA FileMan's lookup utilities loop through a subscript in an index when entries are returned or displayed to the user. This is especially useful for dates. Developers can store dates in their natural internal VA FileMan date format, and still display entries in the date index in reverse date order.
- **Lookup Prompt**—Each subscript on an index in the new INDEX file can be assigned a LOOKUP PROMPT. This prompt will be used as the prompt for entry of the lookup value during classic VA FileMan lookup ^DIC calls. If not filled in, VA FileMan will default to use the name of the field for that subscript value, if there is one.
- **Computed Values**—Those with programmer access can have any value in the cross-reference be computed; that is, the value is determined from M code that sets the variable X.
- **Subscript Transforms**—Those with programmer access can define a *Transform for Storage* and a *Transform for Display* on subscripts in an index. The *Transform for Storage* is code that transforms the internal value of a field before it is stored as a subscript in the index. The *Transform for Display* is code that transforms the value stored in the index back to a form that can be displayed to the user.

SET and Kill Conditions—Those with programmer access can enter M code that specifies whether the set or kill logic is fired. The M code sets the variable X to Boolean true only if the logic should be executed. The "before" and "after" values are available in the X, X1, and X2 arrays (see Table 24 below).

- **The X, X1, and X2 Arrays**—Those with programmer access can reference the X, X1, and X2 arrays in the SET and KILL logic and the SET and KILL conditions of New-Style cross-references. When a field is edited and the cross-reference logic is executed, the field's corresponding X1 array element contains the old value of the field, the X2 array element contains the new value of the field, and the X array element contains either the old or new value, depending on whether the SET logic, SET condition, KILL logic, or KILL condition is being executed:

Array	Value in KILL Logic/KILL Condition	Value in SET Logic/SET Condition
X(order#)	Old value	New value
X1(order#)	Old value	Old value
X2(order#)	New value	New value

Table 24: X, X1, and X2 Arrays

The variables X, X1, and X2 always equal X(1), X1(1), and X2(1), respectively.

If an order number in the cross-reference refers to the .01 field, X1(order#) is set to null when the SET logic and SET condition are executed during record creation. Similarly, X2(order#) is set to null when the KILL logic or condition are executed during record deletion.

- **Key Support**—A regular New-Style index can be used as the Uniqueness Index for a key. VA FileMan ensures that all fields in a Uniqueness Index have values (are not null), and that those values, taken collectively, are unique across all records in the file.

For more information on keys and how to create them, please see the Key Definition topic.

Edit a New-Style Cross-reference

To edit a New-Style cross-reference, identify the file or subfile you wish to edit. VA FileMan will display the cross-references on the file and offer you the choices of Edit, Delete, or Create:

```
Select OPTION: UTILITY FUNCTIONS
Select Utility Functions Option: CROSS-REFERENCE A FIELD OR FILE

What type of cross-reference (Traditional or New)? Traditional// NEW
MODIFY WHAT FILE: TEST
Select Subfile: <RET>

Current Indexes on file #16026:
  75      'COMP' index
  85      'XR202' index
 106      'H' index
 116      'AC' index
 141      'C' index

Choose E (Edit)/D (Delete)/C (Create): EDIT

Which Index do you wish to edit? C
```

Figure 168: Editing a New-Style Cross-reference

The numbers displayed to the left of each cross-reference are the Internal Entry Number of the cross-reference stored in the INDEX file.

You will then be taken into a ScreenMan form where you can edit the properties of the New-Style cross-reference, as shown below:

```
Number: 141                                EDIT AN INDEX                                Page 1 of 2
-----
  File: 16026                               Root File: 16026
 Index Name: C                             Root Type: INDEX FILE

Short Description:
Description (wp):      (empty)

  Type: REGULAR

  Activity: IR
 Execution: FIELD

  Use: LOOKUP & SORTING

-----
COMMAND:                                Press <PF1>H for help  Insert
```

Figure 169: Editing a New-Style Cross-reference in Screen Mode

 For additional help, enter a single question mark ("?") or two question marks ("??") at any prompt.

Create a New-Style Cross-reference

To create a New-Style cross-reference, proceed in the following manner:

```

Select OPTION: UTILITY FUNCTIONS
Select Utility Functions Option: CROSS-REFERENCE A FIELD OR FILE

What type of cross-reference (Traditional or New)? Traditional// NEW
MODIFY WHAT FILE: TEST
Select Subfile: <RET>

Current Indexes on file #16026:
  75   'COMP' index
  85   'XR202' index
 106   'H' index
 116   'AC' index
 141   'C' index

Choose E (Edit)/D (Delete)/C (Create): CREATE
Want to create a new Index for this file? No// YES

Type of index: REGULAR// <RET>

Want index to be used for Lookup & Sorting
  or Sorting Only: LOOKUP & SORTING// <RET>

Index Name: J// <RET>

```

Figure 170: Creating a New-Style Cross-reference

The numbers displayed to the left of each cross-reference are the Internal Entry Number of the cross-reference stored in the INDEX file.

You will then be taken into a ScreenMan form where you can edit the properties of the New-Style cross-reference, as shown below:

```
Number: 142                                EDIT AN INDEX                                Page 1 of 2
-----
File: 16026                                Root File: 16026
Index Name: J                               Root Type: INDEX FILE

Short Description:
Description (wp):      (empty)

Type: REGULAR

Activity: IR
Execution: FIELD

Use: LOOKUP & SORTING

-----
COMMAND:                                Press <PF1>H for help                                Insert
```

Figure 171: Creating a New-Style Cross-reference in Screen Mode

 For additional help, enter a single question mark ("?") or two question marks ("??") at any prompt.

Delete a New-Style Cross-reference

The following dialogue shows you how to delete a New-Style cross-reference:

```
Select OPTION: UTILITY FUNCTIONS
Select Utility Functions Option: CROSS-REFERENCE A FIELD OR FILE

What type of cross-reference (Traditional or New)? Traditional// NEW
MODIFY WHAT FILE: TEST
Select Subfile: <RET>

Current Indexes on file #16026:
  75   'COMP' index
  85   'XR202' index
 106   'H' index
 116   'AC' index
 141   'C' index

Choose E (Edit)/D (Delete)/C (Create): DELETE

Which Index do you wish to delete? 141 <RET> C
Are you sure you want to delete the Index? No// YES

  Index definition deleted.
  Removing old index ... DONE!

Press RETURN to continue: <RET>
```

Figure 172: Deleting a New-Style Cross-reference

Identifier

If you want to uniquely identify an entry in your file by a combination of fields, and to force that uniqueness, then you will most likely want to create a KEY on your file, rather than using Identifier fields (which don't force the uniqueness). If a field is part of the PRIMARY KEY for a file, then it should not be marked as an Identifier as well.

For more information on creating a KEY, please refer to the "Key Definition" topic that follows in this chapter.

An identifier is a designation you can give to a field that you want permanently associated with the .01 field (NAME) of a file. The SSN field of our PATIENT file example has been defined as an identifier field. Each time a patient's entry is referenced, the SSN will be displayed to help positively identify the entry. When a new entry is added to the file, the user will be asked to provide the SSN.

A field that is not multiple-valued can be specified as an identifier for a file simply by using the Identifier option available on the Utility Functions submenu.

A multiple-valued field *cannot* be designated as an identifier, however, a subfield of that multiple-valued field *can* be designated as an identifier for the multiple. The DIAGNOSIS field in the PATIENT file cannot, for example, be designated as an identifier, but its subfield AGE AT ONSET can be designated as an identifier of DIAGNOSIS. This feature is discussed in more detail later in this section.

These are the steps for setting up the sample SSN field as an identifier:

```

MODIFY WHAT FILE: PATIENT
Select FIELD: SSN
Want to make 'SSN' an identifier? NO// Y <RET> (YES)
Want to display SSN whenever a lookup is done
on an entry in the 'PATIENT' file? YES // <RET> (YES)
  
```

Figure 173: An Example of Setting the a Field as an Identifier

Here, the positive answer to the last question causes the patient's SSN value to show up whenever a lookup on a patient is done. For example:

```
Select PATIENT NAME: DOE
  1  DOE, JANE      323223333
  2  DOE, JANET    414114444
CHOOSE 1-2:
```

Figure 174: An Example of an Identifier Field Displayed When Doing a Lookup

An identifier field will not be asked if its WRITE access security does not match the VA FileMan Access Code of the user. If the identifier field has been specified (in the Modify File Attributes option) as a required field, the user must type a valid answer to its prompt when it is asked as an identifier; otherwise, the entry just created is deleted.

Using the up-arrow key ("^") for jumping is not allowed for identifier fields in the Enter or Edit File Entries option when adding a new entry. If you attempt to use the up-arrow key in a field designated as an identifier in an edit session, the entry just created is deleted. Since the SSN field in our example is mandatory and an identifier, this ensures that every patient in our PATIENT file will have an SSN recorded.

As mentioned above, you could make the AGE AT ONSET subfield an identifier for the multiple DIAGNOSIS field as follows:

```
Select UTILITY OPTION: IDENTIFIER
Select FIELD: DIAGNOSIS      (multiple)
Select DIAGNOSIS SUB-FIELD: AGE AT ONSET
Want to make 'AGE AT ONSET' an Identifier? NO// Y <RET> (YES)
Want to display AGE AT ONSET whenever a lookup is done
on an entry in the 'DIAGNOSIS' file? YES// N <RET> (NO)
```

Figure 175: An Example of a Subfield as an Identifier

As a result of this dialogue, every time a new DIAGNOSIS for a patient is entered, the AGE AT ONSET would be asked. The AGE AT ONSET would not, however, be automatically displayed at subsequent DIAGNOSIS lookups.

To drop a field's status as an identifier, simply return to the Identifier option, select the field, and answer YES to the question:

```
Field is already an Identifier; want to delete it? NO// Y
```

Figure 176: Deleting an Identifier Field

Re-Index File

Use the Re-Index File option when you create a new cross-reference on a field that already contains data and you want to re-index the file. The following dialogue is presented when re-indexing a file:

```
DO YOU WISH TO RE-CROSS-REFERENCE ONE PARTICULAR INDEX? NO// <RET>
OK, ARE YOU SURE YOU WANT TO KILL OFF THE EXISTING INDEX? NO// Y <RET> (YES)
DO YOU THEN WANT TO 'RE-CROSS-REFERENCE'? YES// <RET>
```

Figure 177: Sample Dialogue When Re-indexing a File

All the cross-references for the file will be fired except for bulletins. This dialogue will execute triggers and MUMPS cross-references.

If a file contains more than one cross-reference, you can get a list of them by entering a single question mark ("?") in response to the "DO YOU WISH TO RE-CROSS-REFERENCE ONE PARTICULAR INDEX?" prompt. You can then re-index a single cross-reference or all of the file's cross-references.

INPUT Transform (Syntax)

If you have programmer access, you will be able to edit a field's INPUT transform or syntax checker.

For a detailed description of the INPUT transform, please refer to the "Input Transforms" section in the *VA FileMan Programmer Manual*.

Edit File

The Edit File option available on the VA FileMan Utility Functions submenu displays the various attributes of a file you specify in Screen Mode (i.e., invokes a ScreenMan form).

Here is an example using the Edit File option with the ORDER file (#100) in Screen Mode:

```
Select Utility Functions Option: edit File
MODIFY WHAT FILE: ORDER// <RET>
```

Figure 178: Choosing the Edit File Option

You will then be taken into a ScreenMan form where you can edit the properties of the file, as shown below:

```
FILE NAME: ORDER                                     (File # 100)
                DESCRIPTION...
Select APPLICATION GROUP:
                DEVELOPER:
DATA DICTIONARY ACCESS: #
                READ ACCESS: #
                WRITE ACCESS: #
                DELETE ACCESS: #
                LAYGO ACCESS: #
                AUDIT ACCESS: #
                DD AUDIT: NO
ASK 'OK' WHEN LOOKING UP AN ENTRY: NO
POST-SELECTION ACTION:
                LOOK-UP PROGRAM:
CROSS-REFERENCE ROUTINE: ORD2

COMMAND:                                             Press <PF1>H for help Insert
```

Figure 179: Using the Edit File Option in Screen Mode

You can use this option to:

- Edit the Name of a File—Edit the file name at the "FILE NAME:" prompt.
- Delete a File—If you enter an at-sign ("@") at the "FILE NAME:" prompt, you are given the choice of deleting the **entire file** and its data attribute dictionary (including all of its templates and file definitions) or just deleting the **current individual entries in the file**. However, you *cannot* delete a file that is pointed to by another file.
- Enter or Edit the Description of a File—You can enter or edit the word processing text description for documenting the file at the "DESCRIPTION..." prompt. This description appears in the Standard, Modified Standard, and Global Map format data dictionary listings.
- Enter or Edit the Application Group—You can enter or edit the Application Group at the "Select APPLICATION GROUP:" prompt. Enter a namespace (from two to four characters) indicating a package accessing this file.
- Enter or Edit the Developer's Name—You can enter or edit the name of the package developer at the "DEVELOPER:" prompt. Entering two question marks ("??") lets you choose from a list of names.
- Enter or Edit the File Access Parameters—You can enter or edit the security access to a file by making entries at the "DATA DICTIONARY ACCESS:", "READ ACCESS:", "WRITE ACCESS:", "DELETE ACCESS:", "LAYGO ACCESS:", and/or "AUDIT ACCESS:" prompts.

File security is fully explained in the "Data Security" chapter in this manual.

- Turn Auditing On/Off for a File's Data Dictionary—If you want to turn auditing on for data dictionary changes, enter YES at the "DD AUDIT:" prompt. Answer NO, if you don't want to audit data dictionary changes.

Auditing is fully explained in the "Auditing" chapter in this manual.

- Ask/Don't Ask Users to Confirm Their Entry Selection—If you want users who select an entry in a file (for any lookup purpose) to confirm their entry selection by answering positively at the "...OK?" prompt, answer YES at the "ASK 'OK' WHEN LOOKING UP AN ENTRY:" prompt. If you don't want users to confirm their entry selection, answer NO at the "ASK 'OK' WHEN LOOKING UP AN ENTRY:" prompt. The default is NO.

Here's a tip—Use this feature on files containing many similar or confusingly named entries (e.g., files for drugs).

- **Enter or Edit a Post-Selection Action (only available when you have programmer access)**—If you have programmer access, you can write M code for a Post-Selection Action, for entries in this file.

Post-Selection Action is explained in the VA FileMan Programmer Manual.

- **Enter a Lookup Routine (only available when you have programmer access)**—If you have programmer access, you also can enter an existing lookup routine. To do this, enter a routine namespace (from three to six characters, no "^") at the "LOOK-UP PROGRAM:" prompt. The name you choose for the lookup routine must be a routine currently on the system. This special lookup routine will be executed instead of the standard VA FileMan lookup logic, whenever a call is made to ^DIC.
- **Specify that Cross-references on a File Should be Compiled (only available when you have programmer access)**—If you have programmer access, you also can specify that cross-references on a file should be compiled. To do this, enter a routine namespace (from three to six characters, no "^") at the "CROSS-REFERENCE ROUTINE:" prompt. This will become the namespace of the compiled routine(s). If a *new* routine name is entered, but the cross-references are not compiled at this time, the routine name will be automatically deleted.

To stop the use of the compiled cross-references, enter an at-sign ("@") at the "CROSS-REFERENCE ROUTINE:" prompt. At this point, the cross-references are considered uncompiled, and VA FileMan will not use the routine for re-indexing. If you decide later to recompile the cross-references, you will be shown the routine name previously used so that you can easily reuse the same routine name. Stopping the use of the compiled cross-reference does *not* delete the compiled routines. If you want, you can delete those routines manually.

OUTPUT Transform

Sometimes, you might want to display a field differently from the way in which it is stored. For example, a Social Security Number can be entered and stored as nine digits, but you may want it to always be displayed with punctuating hyphens. The Output Transform option allows you to make this kind of specification by associating with any field a computed expression that operates on the value of that field

For details about using M code in an OUTPUT transform, see the "OUTPUT Transform" topic in the "Advanced File Definition" chapters in the "Developer Tools" section of the *VA FileMan Programmer Manual*.

In the dialogue that follows, you'll encounter the responses that you would enter if you want your SSN field to always appear with inserted dashes.

```
Select OPTION: UTILITIES
Select UTILITY OPTION: OUTPUT TRANSFORM
MODIFY WHAT FILE: PATIENT
Select FIELD: SSN
SSN OUTPUT TRANSFORM: $E(SSN,1,3)_"-"_$E(SSN,4,5)_"-"_$E(SSN,6,9)
```

Figure 180: An Example of Creating an OUTPUT Transform

Remember the following:

- **The transform does *not*** apply when you are inputting data—thus, don't enter the dashes when using the Enter or Edit File Entries option.
- To retrieve the internal, stored value of a field that has an OUTPUT transform, you can refer to the INTERNAL(SSN) function.
- The internal form of the date is automatically invoked when you are sorting by a DATE/TIME valued field.

Template Edit

The Template Edit option available on the VA FileMan Utility Functions submenu, is used to edit each of the three types of VA FileMan templates:

- **INPUT**
- **PRINT**
- **SORT**

For each template type, a *two*-screen ScreenMan form is used. This allows you to edit templates in Screen Mode.

The *first* screen of the pair allows you to change the access privileges of the template you're editing:

- **READ ACCESS**—This access controls which class of users [i.e., DUZ(0)] get to *use* the template.
- **WRITE ACCESS**—This access controls which class of users gets to *change* the template.

The *first* screen also allows you to enter a DESCRIPTION for the purpose of documenting what the template does. This DESCRIPTION will be printed on a "TEMPLATES ONLY" data dictionary list, and in the "TEMPLATES" section of other data dictionary listings.

The *second* screen allows you to edit the *contents* of a template. In order to "jump" to the second screen from the first screen in a Screen Mode, you need only press the <PF1><ArrowDown> from wherever you are on the current screen.

The *first* screen provides the usual kind of field-by-field Help in response to entering a single question mark ("?"); all Help messages are displayed in the lower portion of the screen. Also, entering <PF1>H will provide general ScreenMan Help.

The *second* screen, however, does *not* provide help on individual entries. Thus, if you are building a complicated new template from scratch, it is still a good idea to use the traditional, interactive Scrolling Mode with the Enter or Edit File Entries and Print File Entries options.

Here is an example the *first* screen of a PRINT template using the Template Edit option:

```
Select Utility Functions Option: TEMPLATE Edit
MODIFY WHAT FILE: NEW PERSON// <RET>
Select TEMPLATE File: PRINT TEMPLATE

Select PRINT TEMPLATE: XUFILEINQ <RET> XUFILEINQ
                        (Feb 4, 1999@10:40) User #0 File #200
```

Figure 181: An Example of the *First* Screen of a PRINT Template

You will then be taken into a ScreenMan form where you can edit the template properties, as shown below:

```
TEMPLATE NAME: XUFILEINQ          TEMPLATE TYPE:
                    (Compiled as '^XUFILEO' routine)

DATE LAST MODIFIED: FEB 4,1999@10:40
DATE LAST USED: FEB 4,1999
  READ ACCESS: 0
  WRITE ACCESS: 0
  USER #: 0

DESCRIPTION...

HEADER:
[XUFILEINQHDR]
SUB-HEADER SUPPRESSED:

(Print Fields on Next Page...)

COMMAND:                               Press <PF1>H for help Insert
```

Figure 182: Editing a PRINT Template's Properties (*First* Screen) in Screen Mode

The dates shown following the "DATE LAST MODIFIED" and "DATE LAST USED" prompts are for informational purposes only and are *not* editable. Also, if a template

has been "compiled" into a set of routines, an informational message will be displayed near the top of the screen (e.g., "Compiled as '^XUFILE0 routine").

On the *second* screen of the form, you will see the SORT, PRINT, or INPUT fields themselves. Thus, you can use this second screen to edit the specific template fields.

Here is an example of the *second* screen of a PRINT template using the Template Edit option:

```

Editing Print Template "XUFILEINQ"
===== [ INSERT ] =====< (File 200) >===== [ <PF1>H=Help ]=====
$$(#3="0": "Programmer Access to All Files",1:"");C38;L35;"
ACCESSIBLE FILE
  NUMBER;C1;L9;"FILE#"
  ACCESSIBLE FILE;C11;L25
  DATA DICTIONARY ACCESS;R3;"DD"
  DELETE ACCESS;R5;"DELETE"
  LAYGO ACCESS;R5;"LAYGO"
  READ ACCESS;R4;"READ"
  WRITE ACCESS;R5;"WRITE"
  AUDIT ACCESS;R5;"AUDIT"

<=====T=====T=====T=====T=====T=====T=====T=====T=====

```

Figure 183: Editing a PRINT Template's Properties (*Second* Screen) in Screen Mode

As you can see from this example, fields under a Multiple field (e.g., ACCESSIBLE FILE) are *indented*. As you edit, add, and delete subfields here, you must *preserve the indentation*. The same holds true for Relational Navigation within the template; fields jumped to are in a different file and are indented an extra three spaces each. You don't have to indent each new level exactly three spaces, however, there must be some extra number of spaces. Then, if necessary, "un-indent" the same number of spaces to get back to a previous level.

If a SORT template has a user number (i.e., USER #), only that user can use that SORT template in the VA FileMan Print File Entries option. To remove this

restriction, simply delete the user number by entering an at-sign ("@") at the "USER # " prompt.

For SORT templates, you can also use the *first* screen of the Template Edit option to associate a particular PRINT template with a SORT template. Thus, whenever that SORT template is invoked in the Print File Entries option, the associated PRINT template will be used by default, with *no* "FIRST PRINT FIELD:" prompt being displayed to the user.

```
Select Utility Functions Option: TEMPLATE Edit

MODIFY WHAT FILE: NEW PERSON// <RET>
Select TEMPLATE File: SORT TEMPLATE

Select SORT TEMPLATE: XUUFAA <RET> XUUF
                        (JUL 01, 1987@10:51) User #9999 File #200
```

Figure 184: An Example of the *First* Screen of a SORT Template

You will then be taken into a ScreenMan form where you can edit the properties of the template, as shown below:

```
TEMPLATE NAME: XUUFAA

DATE LAST MODIFIED: JUL 1,1987
DATE LAST USED: JAN 29,1999
  READ ACCESS: #
  WRITE ACCESS: #
  USER #: 

DESCRIPTION...

PRINT TEMPLATE: XUUFAA

(Sort Fields on Next Page...)

COMMAND:                                     Press <PF1>H for help 
```

Figure 185: Editing a SORT Template's Properties (First Screen) in Screen Mode

Editing SORT template fields is particularly tricky; however, most SORT templates have only three or so sort levels.

Here is an example of the *second* screen of a SORT template using the Template Edit option:

```

Editing Sort Template "XUUFAA"
===== [ INSERT ] =====< (File 3.05) >===== [ <PF1>H=Help ]=====
SORT BY: DATE/TIME OF ATTEMPT
From: JAN 1 1999
To: T_
    WITHIN DATE/TIME OF ATTEMPT, SORT BY: USER
    From:
    To:
        WITHIN USER, SORT BY: TYPE OF FAILED ATTEMPT
        From:
        To:

<=====T=====T=====T=====T=====T=====T=====T=====T=====

```

Figure 186: Editing a SORT Template's Properties (Second Screen) in Screen Mode

The specifications for each successive level of sorting are indented further to the right. You can add or insert sort levels, however, each sort group of lines must be indented further to the right than the sort group above it. For each level of sorting, except when the sorting is on a Boolean value, there should be a "From:" line and a "To:" line. You can also have a fourth line that says "ASK" or "DON'T ASK," for sort ranges other than first-to-last. Remember to indent each line in a sort group by the same number of spaces.

Uneditable Data

The Uneditable Data option allows you to specify that a field cannot be edited or deleted by a user.

If editing is attempted, the field's value, along with a No Editing message, will be displayed. If, however, the value is part of a subfield, the deletion of the entire entry in the Multiple-valued field will be allowed—unless the .01 field of the Multiple itself is made uneditable.

You can also use this option to remove the uneditable restriction on a field.

Mandatory/Required Field Check

The Mandatory/Required Field Check option checks that fields that are key fields or designated as required contain data. It can check one, a series, or all required entries in a file. If an entry lacks data in a required or key field, a report like the following is furnished:

Required-Field-Check Entry	File: 16026	ZZPATIENT DD-Number/Path	Field	PAGE 1

3	DOE, JANE	16026 DIZ(16026,3	SSN	

Figure 187: Mandatory/Required Field Check Report

If all required and key fields contain data, then the NO REQUIRED FIELD IS MISSING message is displayed.

You can store the results in a template.

Key Definition

The following topics are covered:

- Create a Key
- Edit a Key
- Delete a Key
- Verify a Key

Using the Key Definition option, VA FileMan allows you to define keys on a file or subfile. A key is a group of fields that, taken collectively, uniquely identifies a record. All fields in a key must have values (must not be null) and those values, taken together, must be unique across all records in the file or subfile. VA FileMan enforces KEY INTEGRITY whenever records are added or edited.

Exactly one key in a file must be designated the PRIMARY KEY. All other keys are SECONDARY KEYS. While VA FileMan enforces the integrity of both primary and SECONDARY KEYS, the PRIMARY KEY is VA FileMan's principal means of looking up entries in the file. VA FileMan will prompt for lookup values for each of the PRIMARY KEY fields, and will consider a record a match only if it matches all of the lookup values. The .01 field should be a part of the PRIMARY KEY.

Keys are also useful when transporting data to another system using the Kernel Installation and Distribution (KIDS) system. Since the key fields uniquely identify a record, it is easy to decide whether a record being brought in to the target system needs to be merged to a record that already exists, or whether it is a new record.

Associated with each key is a *Uniqueness Index*, a regular, New-Style cross-reference. The Uniqueness Index helps VA FileMan enforce KEY INTEGRITY and is used during lookup. When you create a new key, you can have VA FileMan create a new Uniqueness Index automatically for you, or you can select an existing index to be the Uniqueness Index of the key. The index you select, though, *must meet the following criteria*:

- It must be a regular, New-Style cross-reference.
- It must be used for lookup and sorting; that is, it cannot have a name that starts with the letter "A".
- It cannot have any set or kill conditions.
- It must consist of only field-type cross-reference values, all of which are used as subscripts; that is, it can contain no computed values.
- No subscripts can have transforms.

Create a Key

To create a key, proceed in the following manner:

```
Select OPTION: UTILITY FUNCTIONS
Select UTILITY OPTION: KEY DEFINITION

MODIFY WHAT FILE: ZZPATIENT// <RET>
Select Subfile: <RET>

There are no Keys defined on file #16026.
Want to create a new Key for this file? No// YES

Enter a Name for the new Key: A// RET
Creating new Key 'A' ...
```

Figure 188: Creating a Key

You will then be taken into Screen Mode (i.e., ScreenMan form) where you can edit the properties of the key. Enter a single question mark ("?") or two question marks ("??") at any prompt for additional help.

```
Number: 5                                EDIT A KEY                                Page 1 of 1
-----
File: 16026                               Name: A                               Priority: PRIMARY
KEY FIELDS:
=====
Field              Seq No.  File           Field Name
-----
Uniqueness Index:
Index Details...

COMMAND:                                Press <PF1>H for help  Insert
```

Figure 189: Creating a Key in Screen Mode

On this screen, in the KEY FIELDS section, you can select the fields you wish to include in this key, and assign each field a sequence number. The sequence number determines the order in which the fields appear as subscripts in the Uniqueness Index. If you select the key fields in this manner, leave the Uniqueness Index field blank. When you exit the form, VA FileMan will prompt you for a name for the Uniqueness Index, and then create the index automatically for you.

```
I'm going to create a new Uniqueness Index to support Key 'A' of File #16026.
Index Name: C// <RET>

One moment please ...
Building new index ... DONE!

Press RETURN to continue:
```

Figure 190: Creating the Uniqueness Index Automatically

Alternatively, you can leave the information in the KEY FIELDS section blank, and select an existing Uniqueness Index. When you exit the form, VA FileMan checks that the information in the KEY FIELDS section is consistent with the selected Uniqueness Index. If there is a conflict, you are asked for a method to resolve the conflict. In this case, select Option #2, "Make Key match Uniqueness Index," as shown below:

```
The Key fields and the fields in the Uniqueness Index don't match.

Select one of the following:

1          Re-Edit the Key
2          Make Key match Uniqueness Index (also selected on up-arrow)

Enter response: 2 <RET> Make Key match Uniqueness Index (also selected on up-
arrow)

Modifying fields in Key ... DONE!
```

Figure 191: Resolving a Conflict with the Key Fields and Uniqueness Index

Edit a Key

To edit a key, identify the file or subfile you wish to edit. VA FileMan will display the cross-references on the file and offer you the choices of Edit, Delete, or Create.

```
Select OPTION:  UTILITY FUNCTIONS
Select UTILITY OPTION:  KEY DEFINITION

MODIFY WHAT FILE:  ZZPATIENT// <RET>
Select Subfile:  <RET>

Keys defined on file #16026:

  A  PRIMARY KEY      Uniqueness Index: C
      Field(s):  1) NAME (#.01)
                 2) SSN (#.02)

Choose V (Verify)/E (Edit)/D (Delete)/C (Create):  EDIT

Which Key do you wish to edit? A// <RET>
```

Figure 192: Editing a Key

You will then be taken into Screen Mode (i.e., ScreenMan form) where you can edit the properties of the key. Enter a single question mark ("?") or two question marks ("??") at any prompt for additional help.

Delete a Key

The following dialogue shows how to delete a key.

You are also given the option of deleting the Uniqueness Index of the key.

```
Select OPTION: UTILITY FUNCTIONS
Select UTILITY OPTION: KEY DEFINITION

MODIFY WHAT FILE: ZZPATIENT// <RET>
Select Subfile: <RET>

Keys defined on file #16026:

  A  PRIMARY KEY      Uniqueness Index: C
      Field(s):  1) NAME (#.01)
                 2) SSN (#.02)

Choose V (Verify)/E (Edit)/D (Delete)/C (Create): DELETE

Which Key do you wish to delete? A// <RET>
Are you sure you want to delete the Key? No// YES

  Key 'A' of File #16026 deleted.

Do you want to delete the 'C' Uniqueness Index (#6) on File #16026 previously
used by Key 'A' of File #16026? YES

  Index definition deleted.
  Removing old index ... DONE!
```

Figure 193: Deleting a Key

Verify a Key

When you verify the integrity of a key, VA FileMan checks that all fields in the key have values (are not null), and that those field values, taken together, are unique across all records in the file. Any problems are reported. You can also save the entries that violate KEY INTEGRITY in a template.

```

Select OPTION: UTILITY FUNCTIONS
Select UTILITY OPTION: KEY DEFINITION

MODIFY WHAT FILE: ZZPATIENT// <RET>
Select Subfile: <RET>

Keys defined on file #16026:

  A PRIMARY KEY      Uniqueness Index: KEYA
    Field(s):  1) NAME (#.01)
               2) SSN (#.02)

Choose V (Verify)/E (Edit)/D (Delete)/C (Create): VERIFY

Which Key do you wish to verify? A// <RET>
STORE THESE ENTRY ID'S IN TEMPLATE: <RET>

DEVICE: HOME// <RET> Telnet terminal

KEY INTEGRITY CHECK                      DEC 31, 1998  09:23    PAGE 1
-----
                Key: A (#5), File #16026
Uniqueness Index: KEYA (#6)

ENTRY #  NAME                      ERROR
-----  -
1        SMITH,JOHN                  Duplicate Key A (#5)
2        SMITH,JOHN                  Duplicate Key A (#5)
3        DOE,JANE                    Missing Key Field(s):
                                     SSN [16026,.02]

```

Figure 194: Verifying a Key

In this example, records #1 and #2 have the same key, and record #3 is missing a value for SSN (field #.02).

Part III: Security

11. Auditing

VA FileMan auditing tracks changes to data in a field (Auditing a Data Field) or changes to the file's structure (Auditing a Data Dictionary). Fields are identified for auditing by using the Modify File Attributes option or by using the Turn Data Audit On/Off option (see the "Turn Data Audit On/Off" topic that follows in this chapter). Thus, a user with limited VA FileMan access does not need the Modify File Attribute option to initiate an audit.

Files are identified for auditing by using the File Edit option.

Auditing can be resource intensive; it can slow your system considerably. It can also use considerable disk space. Use it with discretion.

The auditing options are located in the Other Options submenu:

```
Select OPTION: OTHER OPTIONS
Select OTHER OPTION: AUDITING
Select AUDIT OPTION: ?

CHOOSE FROM:
  1          FIELDS BEING AUDITED
  2          DATA DICTIONARIES BEING AUDITED
  3          PURGE DATA AUDITS
  4          PURGE DD AUDITS
  5          TURN DATA AUDIT ON/OFF

Select AUDIT OPTION:
```

Figure 195: Audit Options

The use of these options is described in the topics that follow in this chapter.

Auditing

Auditing a Data Field

The Enter or Edit File Entries option is used to add, change, or delete data values. For example, an admission clerk can use the Enter or Edit File Entries option to enter a social security number of 123456789 for the patient Richard Green. Later, a pharmacy technician could use the same option to change the value to 987654321. You might like to know who made the change and when; the data field audit capability is designed to record this information.

When changes like the ones mentioned above are made to an audited field, the date and time the change was made, the user's name, and the old and new data values are stored in the AUDIT file (#1.1). In other words, starting an audit on a data field provides an ongoing chronological list of who made what changes to data values of fields you are auditing.

Setting a Data Field Audit

To begin auditing data changes in a field, use the Modify File Attributes option, choose the file and fields that should be audited and answer YES or EDITED to the "AUDIT:" prompt. The possible responses to the "AUDIT:" prompt are:

Response	Description
YES, ALWAYS	Indicates the audit will occur when data is initially entered, changed or deleted.
EDITED OR DELETED	Means that the audit only occurs when changes are made or values deleted (<i>not</i> when the data is initially entered).
NO	Turns the audit off.
@	Deletes the current audit status (effectively turning audit off), not the field.

Table 25: "AUDIT" Prompt Response

The following example initiates a Data Field audit on the DATE OF BIRTH field of the PATIENT file. Only changes to pre-existing data will be recorded:

```
Select OPTION: MODIFY FILE ATTRIBUTES
DO YOU WANT TO USER THE SCREEN-MODE VERSION? Yes// N <RET> (No)

MODIFY WHAT FILE: PATIENT

Select FIELD: DATE OF BIRTH
LABEL: <RET>
TITLE: <RET>
AUDIT: EDITED <RET> EDITED OR DELETED
.
.
.
```

Figure 196: An Example of a Data Field Audit

If you have programmer access, you are also presented with the "AUDIT CONDITION:" prompt. Here, you can restrict the data entries that will be audited. Enter a line of M code that must evaluate true or false. If it evaluates true, an audit record of the value change is made. Otherwise, no auditing is done for that data entry.

 For more information on the audit condition, please refer to the "Advanced File Definition" chapter in the *VA FileMan Programmer Manual*.

 If auditing is not turned on for the field with a YES or EDITED answer to the "AUDIT:" prompt, the field will not be audited, even if code is entered at the "AUDIT CONDITION:" prompt.

Fields with a DATA TYPE of COMPUTED or WORD-PROCESSING cannot be audited.

In order to initiate an audit of data fields or of a data dictionary, you must have AUDIT access to the files you want to audit.

 For more information about AUDIT access, please refer to the "Data Security" chapter in this manual.

Turning Data Field Audit On/Off

Users who do not have the Modify File Attributes option (DD access) to files can be given the Turn Data Audit On/Off option. This option is found on VA FileMan's Auditing submenu. It is used to begin or end an audit trail for fields. The user must have AUDIT access to the file to set data audits. No other access is necessary. The Turn Data Audit On/Off option is called DIAUDIT TURN ON/OFF; it can be granted to users with Kernel's menu management options. No other attributes in the field definition can be affected by use of this option.

Use of Turn Data Audit On/Off is very similar to using the Modify File Attributes option:

```
Select OPTION: OTHER OPTIONS
Select OTHER OPTION: AUDITING
Select AUDITING OPTION: TURN DATA AUDIT ON/OFF
AUDIT FROM WHAT FILE: PATIENT
Select FIELD: DATE OF BIRTH
AUDIT: EDITED OR DELETED
```

Figure 197: Turning a Data Audit On

To end the audit trail, simply re-enter the Turn Data Audit On/Off option and turn the audit off by entering NO at the "AUDIT:" prompt:

```
AUDIT: EDITED OR DELETED// NO <RET> NO
```

Figure 198: Turning a Data Audit Off

Reviewing the Data Field Audit Trail

Use the Inquire to File Entries or Print File Entries options to query the AUDIT file (#1.1) to obtain audit information. Suppose the PATIENT file is edited so that the entry Green is first assigned an SSN of 123456789 and that SSN is changed to 987654321. These data modifications are recorded in the AUDIT file. Inquire as shown below:

```
Select OPTION: INQUIRE TO FILE ENTRIES

OUTPUT FROM WHAT FILE: PATIENT// AUDIT <RET> 1.1
AUDIT FROM WHAT FILE: PATIENT// <RET> (1890 entries)
Select PATIENT AUDIT: ??
CHOOSE FROM:
1          355          03-30-87@14:37
2          355          03-31-87@15:35
```

Figure 199: Querying the AUDIT file

Entering two question marks ("??") at the "Select..." prompt shows you your choices. The selections are identified first by their internal entry number in the AUDIT file, then by the internal entry number of the edited entry from the file being audited, and finally by the date/time of the audited event. Green is the 355th entry in the PATIENT file. The name of the user making the data change is also recorded and can be used for lookup in the AUDIT file.

```
Select PATIENT AUDIT: 1 <RET>          355          03-30-87@14:37
ANOTHER ONE: <RET>
STANDARD CAPTIONED OUTPUT? YES// <RET> (YES)
DISPLAY COMPUTED FIELDS? NO// Y <RET> (YES)
```

Figure 200: Selecting the Person and the Audit Output Format and Content

Responding with YES at the "DISPLAY COMPUTED FIELDS? NO//" prompt shows the AUDIT file's COMPUTED fields: ENTRY NAME, FIELD NAME, OLD VALUE, and NEW VALUE. A NO response will *not* show these fields.

The following output is produced:

```

NUMBER: 1                INTERNAL ENTRY NUMBER: 355
  DATE/TIME RECORDED: MAR 30, 1987 14:37:05
  FIELD NUMBER: 2        USER: PHARMACY,TECH
ENTRY NAME (c): GREEN,RICHARD FIELD NAME (c):DATE OF BIRTH
OLD VALUE (c): 1/20/49 NEW VALUE (c): 1/20/50

```

Figure 201: Audit Output

A (c) appears after the COMPUTED fields in the AUDIT file.

If you deleted Green's DATE OF BIRTH, the subsequent audit will show the NEW VALUE as <deleted>. If the entire entry for Green were deleted, there would be no value for the ENTRY NAME field in any earlier audit listings, the last of which would show <deleted> for the NEW VALUE of the DATE OF BIRTH field.

Tracking Data Field Audits

Use the Fields Being Audited option to list the audited fields from a file or a specified range of files. After selecting the Fields Being Audited option, give a file (or a range) at the "START WITH WHAT FILE:" and "GO TO WHAT FILE:" prompts. You receive a report with the file number, field number, field name, type of field being audited, and the type of audit being performed. Currently, this option only lists audited fields at the file's top level; fields audited in a Multiple don't appear in this listing.

The listing below shows all fields flagged for auditing in a file range:

AUDITED FIELDS					JAN 20, 1989	10:10	PAGE 1
FILE	NUMBER	LABEL	TYPE	AUDIT	-----		
16	2	DOB	DATE/TIME	YES, ALWAYS			
40.5	10	LOCATION	POINTER	EDITED OR DELETED			
1036	1	SEX	SET	EDITED OR DELETED			
1036	7	SSN	FREE TEXT	YES, ALWAYS			

Figure 202: Sample Listing Showing Fields Flagged for Auditing

Purging a Data Field Audit Trail

Use the Purge Data Audits option to purge the audit trail. It will purge the records used for auditing data fields for a specified file. Purging audit trails is not an automatic feature; it must be done manually.

You should either 1) turn auditing off on the files you're purging while you're doing the purge, or 2) leave auditing on but purge the file when not many users are on the system. If you purge when auditing is on and people are using the file in question, it is possible that you might end up with incomplete audit records on the audited file.

Purged audit records cannot be recovered!

The following dialogue illustrates purging *selected* records from the audit trail:

```
Select OPTION: OTHER
Select OTHER OPTION: AUDITING
Select AUDIT OPTION: PURGE DATA AUDITS
AUDIT FROM WHAT FILE: PATIENT
DO YOU WANT TO PURGE ALL DATA AUDIT RECORDS? NO// <RET>
```

Figure 203: Choosing to Purge Only *Selected* Data Audit Records

Answering NO to the "DO YOU WANT TO PURGE ALL DATA AUDIT RECORDS? NO//" prompt allows you to specify which entries to purge.

```

PURGE AUDIT RECORDS BY: INTERNAL ENTRY NUMBER// ??

CHOOSE FROM:
.001          NUMBER
.01           INTERNAL ENTRY NUMBER
.02           DATE/TIME RECORDED
.03           FIELD NUMBER
.04           USER
1             ENTRY NAME
1.1          FIELD NAME
2            OLD VALUE
2.1          OLD INTERNAL VALUE
2.2          DATATYPE OF OLD VALUE
3            NEW VALUE
3.1          NEW INTERNAL VALUE
3.2          DATATYPE OF NEW VALUE

TYPE '-' IN FRONT OF NUMERIC-VALUED FIELD TO SORT FROM HI TO LO
TYPE '+' IN FRONT OF FIELD NAME TO GET SUBTOTALS BY THAT FIELD,
'#' TO PAGE-FEED ON EACH FIELD VALUE, '!' TO GET RANKING
NUMBER,
'@' TO SUPPRESS SUB-HEADER, '[' TO FORCE SAVING SORT TEMPLATE
TYPE [TEMPLATE NAME] IN BRACKETS TO SORT BY PREVIOUS SEARCH RESULTS

```

Figure 204: Listing Internal Entry Numbers for Data Audit Fields for Possible Purging

You can specify which records to purge by referencing any field in the AUDIT file. You can select the records by using the same criteria available at the "SORT BY:" prompt.

For more details on the "SORT BY:" prompt, please refer to the "Print: How to Print Reports from Files" chapter in the *VA FileMan Getting Started Manual*.

```

PURGE AUDIT RECORDS BY: INTERNAL ENTRY NUMBER// USER
START WITH USER: FIRST// CHIEFTAIN
GO TO USER: LAST// CHIEFTAIN
  WITHIN USER, PURGE AUDIT RECORDS BY: <RET>

DEVICE: <RET>

...HMMMM, LET ME PUT YOU ON 'HOLD' FOR A SECOND...

PURGE OF AUDIT DATA:  PATIENT          FEB 21, 1990   13:26   PAGE 1
-----
4 RECORDS PURGED.

```

Figure 205: Purging Selected Audit Records from a File

Auditing

The following dialogue purges *all* records from the PATIENT file's audit trail:

```
AUDIT FROM WHAT FILE: PATIENT
DO YOU WANT TO PURGE ALL DATA AUDIT RECORDS? NO// YES
ARE YOU SURE? NO// YES

DELETED
```

Figure 206: Purging All Audit Records from a File

Auditing a Data Dictionary

In addition to auditing changes to data values, you can audit changes to data dictionaries.

Setting Up a Data Dictionary Audit

Start an audit on a data dictionary by using the Edit File option on the Utility Functions submenu. You should answer YES to the "DD AUDIT?" prompt.

When you start an audit, VA FileMan begins an audit trail of changes made to the data dictionary. Changes to the definitions of fields in the file are audited. Fields in Subfiles are audited, too. Changes made to the definition of the file, using the Edit File option, are not audited. The changes are recorded in the DD AUDIT file (#.6).

An example of starting a data dictionary audit follows:

```
Select OPTION: UTILITY FUNCTIONS
Select UTILITY OPTION: EDIT FILE

MODIFY WHAT FILE: PATIENT
NAME: PATIENT// <RET>
DESCRIPTION:
  1> <RET>
Select APPLICATION GROUP: <RET>
DEVELOPER: <RET>
VERSION: <RET>
DATA DICTIONARY ACCESS: <RET>
READ ACCESS: <RET>
WRITE ACCESS: <RET>
DELETE ACCESS: <RET>
LAYGO ACCESS: <RET>
AUDIT ACCESS: <RET>
DD AUDIT? NO// YES
ASK 'OK' WHEN LOOKING UP AN ENTRY? NO// ^
```

Figure 207: Starting a Data Dictionary Audit

Reviewing the Data Dictionary Audit Trail

To see what changes were made to the data dictionary, use the Inquire to File Entries or Print File Entries option and identify the DD AUDIT file (#.6) as the file of choice. The Data Dictionaries Being Audited option is just used to display a list of data dictionaries being audited; it doesn't include the changes made to audited data dictionaries. The following dialogue is an example of how to identify the changes made to a data dictionary:

```
Select OPTION: INQUIRE TO FILE ENTRIES

OUTPUT FROM WHAT FILE: .6 <RET> DD AUDIT
AUDIT FROM WHAT FILE: PATIENT

Select PATIENT SUB-FILE: <RET>
```

Figure 208: Choosing to Review a Data Dictionary Audit

You only see the "SUB-FILE" prompt if the file contains a Subfile. To display audit information for the Subfile, specify it here.

```
Select PATIENT DD AUDIT: ?

ANSWER WITH ZZPT DD AUDIT NUMBER, OR FIELD NUMBER, OR DATE
UPDATED, OR USER
CHOOSE FROM:
  1 2 02-20-90 PROGRAMMER,SYSTEMS
  2 3 02-20-90 PROGRAMMER,SYSTEMS
```

Figure 209: Specifying a Data Dictionary Audit

The entries in the DD AUDIT file are identified by the field number (2 and 3 in this example), the date of the change (02/20/90 for both entries), and the person making the change (PROGRAMMER, SYSTEMS for both).

```

Select PATIENT DD AUDIT: 1
ANOTHER ONE: 2
ANOTHER ONE: <RET>
STANDARD CAPTIONED OUTPUT? YES// <RET>
DISPLAY COMPUTED FIELDS? NO// <RET>

NUMBER: 1                                FIELD NUMBER: 2
TYPE: EDIT DATE                          UPDATED: FEB 20, 1990@17:54:36
USER: PROGRAMMER,SYSTEMS                 ATTRIBUTE NAME: LABEL
ATTRIBUTE NUMBER: .01                    FILE NUMBER: 999000
OLD VALUE(S): DATE OF BIRTH              NEW VALUE(S): DOB

NUMBER: 2                                FIELD NUMBER: 3
TYPE: EDIT DATE                          UPDATED: FEB 21, 1990@11:54:03
USER: PROGRAMMER,SYSTEMS                 ATTRIBUTE NAME: LABEL
ATTRIBUTE NUMBER: .01                    FILE NUMBER: 999000
OLD VALUE(S): CURRENT AGE                NEW VALUE(S): AGE

```

Figure 210: Reviewing a Data Dictionary Audit

This example indicates that a user named Systems Programmer modified the PATIENT file (#999000) on 2/20 and 2/21/90. This person edited the LABEL (.01 attribute) of Fields #2 and #3. The LABEL of Field #2 was changed from DATE OF BIRTH to DOB and the LABEL of Field #3 was changed from CURRENT AGE to AGE. The number of the first change as it was recorded in the DD AUDIT file (#.6) is 1 and the second is 2.

Tracking Audited Data Dictionaries

For information on which data dictionaries are being audited, use the Data Dictionaries Being Audited option from the Auditing submenu. Select a range of data dictionaries. VA FileMan displays the file number and file name of the data dictionaries currently being audited, as shown in the example below:

```
Select OTHER OPTION: AUDITING
Select AUDIT OPTION: DATA DICTIONARIES BEING AUDITED
START WITH NUMBER:  FIRST// 2
GO TO NUMBER:  LAST// 34
DEVICE:  HOME// <RET>

DATA DICTIONARIES BEING AUDITED AUG 30, 1989  18:08  PAGE 1

FILE              NAME
-----
3                 USER
9.4              PACKAGE
30               LOCATION
```

Figure 211: Tracking Audited Data Dictionaries

Purging a Data Dictionary Audit Trail

Use the Purge DD Audits option to erase all audit trails used in auditing data dictionaries (including Subfiles, which have their own data dictionaries) for a specified file. Purging is not an automatic feature, it must be done manually.

You should either 1) turn auditing off on the files you're purging while you're doing the purge, or 2) leave auditing on but purge the file when not many users are on the system. If you purge when auditing is on and people are using the file in question, it is possible that you might end up with incomplete audit records on the audited file.

The following dialogue results in purging *selected* data dictionary audit records for the user Ringleader:

```

Select AUDIT OPTION: PURGE DD AUDITS
AUDIT FROM WHAT FILE: PATIENT
Select PATIENT SUB-FILE: <RET>
DO YOU WANT TO PURGE ALL DD AUDIT RECORDS? NO// NO

PURGE DD AUDIT RECORDS BY: FIELD NUMBER// USER
START WITH USER: FIRST// RINGLEADER
GO TO USER: LAST// RINGLEADER
  WITHIN USER, PURGE AUDITS RECORDS BY: <RET>
DEVICE: <RET>

HOLD ON, PLEASE...

PURGE OF DD AUDIT: PATIENT FILE      FEB 21, 1990   14:45   PAGE 1
-----
9 RECORDS PURGED.

```

Figure 212: Purging *Selected* Data Dictionary Audit Records

The following dialogue results in purging *all* data dictionary audit records for the PATIENT file:

```

AUDIT FROM WHAT FILE: PATIENT
Select PATIENT SUB-FILE: <RET>
DO YOU WANT TO PURGE ALL DD AUDIT RECORDS? NO// YES
ARE YOU SURE? NO// YES

DELETED

```

Figure 213: Purging *All* Data Dictionary Audit Records

Auditing

12. Data Security

VA FileMan has facilities for screening access to entire files *and* to data within files on a field-by-field basis. Access to previously defined templates is also controlled.

When used with Kernel, there are two possible mechanisms for control of user access:

1. By associating an Access Code with every user and with every file, field, and template on the system. The user's Access Code is stored in the local variable.
2. **Or**, by doing a lookup into a user's entry in the NEW PERSON file (#200) to see if the file in question is available to that user. (The method is in effect only if Kernel's File Access Security has been installed on the system. It takes precedence over the Access Code method for file-level security. Field and template security are unaffected by Kernel's File Access Security; they remain enforced by Access Code.)

These methods for data security are described in this chapter.

Security at the File Level

There are two methods of controlling access to files:

- Access Code Security on Files
- File Access Security (Formerly Part 3 of Kernel)

On a particular system only one method is in effect at a particular time. If File Access Security has been installed, it controls file-level security. Otherwise, access is controlled by Access Codes. Obviously, if you are using VA FileMan without Kernel, only Access Code security is possible.

Access Code Security on Files

The Access Code is a string of characters that correspond to functional data access categories. For example, **A** might correspond to entry/editing of Administrative Data, a lower case **a** might correspond to viewing of Administrative data, **F** might correspond to entering or editing of Fiscal data, and **f** to viewing of Fiscal data.

Typically, you go through a password-checking signon process before using VA FileMan. During signon, you are identified by the system and your Access Code is set. For example, it might be equal to **Aaf**, if you are identified as someone entitled to view and change Administrative data, but only to view (search and print) Fiscal data. If you lack any such security clearance, the default value of the Access Code entry is simply null.

The following Access Codes are used to control access to files in six different ways:

Access Code	Description
READ	Controls use of the file by Print File Entries, Search File Entries, Inquire to File Entries, Statistics, List File Attributes, and Transfer File Entries (transfer-from file) options.
WRITE	Controls use of Enter or Edit File Entries and Transfer File Entries (transfer-to file) options.
DELETE	Controls deletion of an entire entry in the Enter or Edit File Entries or the Transfer Entries options.
LAYGO	Controls creating a new entry within the Enter or Edit File Entries option. You must have LAYGO as well as WRITE access to a file to add new entries. Additionally, you must have WRITE access on the field level to all required identifiers.
DD	Controls use of the Modify File Attributes and Utility Functions (Data Dictionary) options.
AUDIT	Controls the setting of auditing characteristics and the deletion of audit trails.

Table 26: File Access Codes

All these controls are based on the value of the Access Code. When you access a file, under any of these options, you will *not* be allowed to access any file that is protected unless your current Access Code either equals an at-sign ("@"), or contains at least one character in common with the protection code string of the file. The at-sign ("@") is generally reserved for use by programmers; it gives programmer access.

Any new file that you create with a code string in your Access Code will automatically be given READ, WRITE, DELETE, LAYGO, and AUDIT Access Codes equal to that code string. To change these codes later, use the Edit File option of the Utility Functions submenu. Be sure when doing so that your own Access Code contains the codes you want to add or equals the at-sign ("@").

File Access Security (Formerly Part 3 of Kernel)

VA FileMan also has the ability to perform a lookup into a user's record and see if a specific file has been assigned. If your Systems Manager has run the special conversion to have access controlled by the ACCESSIBLE FILE Multiple in the NEW PERSON file (#200), then access to a file is not based on an Access Code. Rather, a lookup is done in your record to see if you are allowed access to the file in question. If your VA FileMan Access Code is the at-sign (@), you will be allowed access to all files, even if this special conversion has been performed.

Access to files is granted to you by the Systems Manager who uses Kernel's File Access Security system.

For detailed information about File Access Security, please refer to the Kernel manuals.

Protection for Fields in a File

Your Access Code is checked to control access to data fields within each file.

File Access Security does *not* affect field-level protection.

Access Code	Description
WRITE	The Enter or Edit File Entries option looks at the WRITE access for every field used to see if the WRITE access has been defined. If the field's WRITE Access Code has no characters in common with your Access Code, you will not be able to see that field.
DELETE	The Enter or Edit File Entries option looks at the DELETE access of a field when you try to delete a value for that field (with the at-sign ["@"]). If there is a DELETE access string and if it has no characters in common with your Access Code, you will be prohibited from deleting.
READ	The Inquire to File Entries, Print File Entries, and Search File Entries options look at the READ access for every field accessed. If this READ Access Code has no characters in common with your Access Code, you cannot see data stored in the field.

Table 27: Field Access Codes

There is an exception to this field protection: If the invoking program has set the Access Code equal to the at-sign ("@"), all fields will be accessible. The at-sign ("@" is also considered the programmer's Access Code to the *entire* data dictionary.

To enter or edit a field's READ, DELETE, or WRITE access, use the Modify File Attributes option, indicate the field to be protected, and enter the desired codes when asked for the "READ ACCESS:," "DELETE ACCESS:," and "WRITE ACCESS:" information. Any code character entered must be in your current Access Code, unless you have the at-sign ("@").

Protection for Templates

When you create an INPUT, SORT, or PRINT template, your Access Code is assigned to that template for READ access and WRITE access. Anyone else subsequently using the template must have a code that has a character in common with the template's READ access. Anyone who is allowed to change the template must have a code with a character in common with the template's WRITE access. When the template is changed, these Access Codes can also be changed.

Print the PRINT TEMPLATE file (#.4), the SORT TEMPLATE file (#.401), and the INPUT TEMPLATE file (#.402) to display the READ access and WRITE access fields for templates.

Every user on the system has a user number. This number is sometimes called the DUZ, because it is stored in the local variable DUZ. The user number is the internal entry number in the NEW PERSON file (#200), if Kernel is installed. VA FileMan uses the user number for security for SEARCH templates. When a SEARCH template is created, it is assigned the DUZ of its creator. Only someone with that DUZ can use the template. You can change the assigned USER # with the Template Edit option. If the USER # is deleted, everyone can use the SEARCH template.

Part IV: Archiving

13. Transferring File Entries

The Transfer Entries submenu contains two options (Transfer File Entries and Compare/Merge File Entries) to allow you to compare and/or merge two entries in a single file or to transfer entries from one file to another. For example, you may need to combine data from two different entries into one of the two. This could happen in a patient database when the same patient has been inadvertently entered twice with the name spelled slightly differently.

Once you have merged file entries, the merging cannot be undone. Care must be taken that data is not mistakenly lost.

Transfer File Entries Option

The Transfer File Entries option can be used for several purposes. You can use it to:

- Merge two entries in the same file
- Transfer one or more records from one file to another file
- Copy a data dictionary into a new file

However, the Compare/Merge File Entries option (described below) should usually be used to merge entries in the same file; it is specifically designed for that task.

You must have READ access for the file you are transferring from and WRITE access for the file you are transferring to. If you are deleting entries after the transfer, you need delete access as well.

For the details of file security, please refer to the "Data Security" chapter in this manual.

Transferring Data Within the Same File

You can use the Transfer File Entries option to merge two entries that are in the same file. To do this:

1. Identify the input and output file as the same
2. Identify the two entries

Data values are then transferred from the FROM entry to the TO entry. The following example shows the simple dialogue:

```

Select OPTION: TRANSFER ENTRIES

Select TRANSFER OPTION: ?
ANSWER WITH TRANSFER OPTION NUMBER, OR NAME
CHOOSE FROM:
   1          TRANSFER FILE ENTRIES
   2          COMPARE/MERGE FILE ENTRIES

Select TRANSFER OPTION: 1 <RET> TRANSFER FILE ENTRIES

INPUT TO WHAT FILE: PATIENT
TRANSFER FROM WHAT FILE: PATIENT
TRANSFER DATA INTO WHICH PATIENT: RECIPIENT, ROGER
TRANSFER DATA FROM PATIENT: SENDER, SAM
WANT TO DELETE THIS ENTRY AFTER IT'S BEEN TRANSFERRED? NO//

```

Figure 214: Transferring Data Within a File

If the TO entry (Roger Recipient in our example) already has a value on file for a given field, that value will be preserved (i.e., it will *not* be overwritten by the corresponding field value in the FROM entry). This rule applies to word processing data fields also. If the recipient has any text on file, corresponding text from the sender's entry is not merged with it. Thus, if you decide to delete the FROM entry (Sam Sender here), you may lose some data.

In the case of distinct Multiple-valued subfields, merging will take place. The subentries in the FROM entry would be added to the Multiple in the TO entry. Further, if two subentries have the same .01 value and if any of the subfields are blank in the TO entry, the FROM subentry's data will be placed in the blank subfield. In this way, data is added to Multiples in the same way that it is added to files.

For example, suppose DIAGNOSIS is the label of the .01 field of a Multiple and AGE AT ONSET is a subfield in that Multiple. If Roger Recipient has a DIAGNOSIS of "Angina" and Sam Sender has one of "Diabetes", Recipient ends up

with both "Angina" and "Diabetes". Further, if both Recipient and Sender had "Angina", but Recipient had no AGE AT ONSET for that subentry and Sender did have one, the Sender's AGE AT ONSET data for "Angina" would be transferred to Recipient.

The following example illustrates the transfer of data values from one entry to another in more detail. (These two entries will also be used in the discussion of the Compare/Merge File Entries option.) Before the transfer, the Inquire to File Entries option displays these two entries from the SCHOLAR file:

```

NAME:  RUSSELL,BERTRAND A.  SSN:  999-99-9999
      SUBJECT AREA:  PHILOSOPHY
TOPICS:  RUSSELL'S PARADOX
TOPICS:  PRINCIPLE OF EXCLUDED MIDDLE
TOPICS:  SET THEORY
TOPICS:  THEORY OF TYPES
TOPICS:  LIAR PARADOX

```

```

NAME:  RUSSELL,BERTRAND W.  DATE OF BIRTH:  1872  SSN:  888-88-8888
      SUBJECT AREA:  MATHEMATICS
TOPICS:  RUSSELL'S PARADOX
TOPICS:  SET THEORY
TOPICS:  THEORY OF TYPES
TOPICS:  AXIOM OF INFINITY

```

Figure 215: An Example Displaying Two Records in a File Prior to a Transfer

The transfer is then initiated with the following dialogue:

```

Select TRANSFER OPTION:  TRANSFER FILE ENTRIES

INPUT TO WHAT FILE:  SCHOLAR
TRANSFER FROM FILE:  SCHOLAR
TRANSFER DATA INTO WHICH SCHOLAR:  RU
      1  RUSSELL,BERTRAND A.
      2  RUSSELL,BERTRAND W.
CHOOSE 1-2:  1
TRANSFER FROM SCHOLAR:  RUSSELL,BERTRAND W.
      WANT TO DELETE THIS ENTRY AFTER IT'S TRANSFERRED?  NO// YES
      ...EXCUSE ME, LET ME THINK ABOUT THAT A MOMENT.....

```

Figure 216: Initiating a Transfer of File Entries

Data values are then merged such that no pre-existing values are overwritten but new values are added. The DATE OF BIRTH is added since the pre-existing value was null. Different subentries in the TOPICS Multiple are added to the pre-existing list of topics. The Inquire to File Entries option shows the result:

```
NAME:  RUSSELL, BERTRAND A.  DATE OF BIRTH:  1872  SSN:  999-99-9999
      SUBJECT AREA:  PHILOSOPHY
TOPICS: RUSSELL'S PARADOX
TOPICS: PRINCIPLE OF EXCLUDED MIDDLE
TOPICS: SET THEORY
TOPICS: THEORY OF TYPES
TOPICS: LIAR PARADOX
TOPICS: AXIOM OF INFINITY

The entry for Russell,Bertrand W. has been deleted.
```

Figure 217: Results After a Transfer of File Entries

Transferring Entries Between Files

You can use the Transfer Entries option to move *all* or a *group* of entries from one file to an entirely separate file. To do this:

1. Answer the "INPUT TO WHAT FILE:" prompt and the "TRANSFER FROM FILE:" prompt with different file names.
2. Specify whether transferred entries should be added all as new, or whether they should be merged with existing entries.
3. Specify whether transferred entries should be deleted in the original file.
4. Specify which entries to transfer, by entering sort criteria.

For transfer to occur, the NAME fields (#.01) of both files must have matching LABELs and DATA TYPES. In this way VA FileMan can identify corresponding entries. Values of the fields can then be transferred. Only those fields where the field LABEL and DATA TYPE match will be transferred. Before the transfer is done, you are told which fields will have their data transferred.

The dialogue presented when transferring entries to another file is presented below. In this instance, you are transferring the contents of the SCHOLAR file to the NEW SCHOLAR file. The NEW SCHOLAR file already exists, and it does have some entries whose NAME field matches those in the SCHOLAR file.

```
Select OPTION: TRANSFER ENTRIES

Select TRANSFER OPTION: TRANSFER FILE ENTRIES

INPUT TO WHAT FILE: NEW SCHOLAR
TRANSFER FROM FILE: NEW SCHOLAR// SCHOLAR
'NAME' FIELDS, 'SSN' FIELDS, 'DATE OF BIRTH' FIELDS, 'SUBJECT AREA'
FIELDS, 'TOPICS' FIELDS, WILL BE TRANSFERRED

WANT TO MERGE TRANSFERRED ENTRIES WITH ONES ALREADY THERE? NO// YES
WANT EACH ENTRY TO BE DELETED AS IT'S TRANSFERRED? NO
TRANSFER ENTRIES BY: NAME// <RET>
START WITH NAME: FIRST// <RET>
DEVICE: HOME// <RET>
```

Figure 218: Transferring Entries from One File to Another

You can specify whether you want entries with the same NAME field to be merged when the transfers are made, or whether each transferred entry and subentry should become a distinct new entry in the target file. (In this case, the answer was YES to merge.) You can also specify whether or not the entries should be deleted from the "from" file as they are transferred. (In this case, the answer was NO to delete.)

A simple report is created that lists the entries that were transferred. You have the ability to route that list to a printer using the "DEVICE:" prompt.

In addition, you have considerable control over which entries are transferred. Your answers to the "TRANSFER ENTRIES BY:" and "START WITH:" prompts select entries in the same way that you specify sort criteria when describing a print output.

For more information on sort criteria and print output, please refer to the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

For example, if you only wanted to transfer scholars born after 1900 to the NEW SCHOLAR file, you could answer the "TRANSFER ENTRIES BY:" prompt like this:

```
TRANSFER ENTRIES BY: NAME// DATE OF BIRTH>1900
WITHIN DATE OF BIRTH>1900, TRANSFER ENTRIES BY: <RET>
```

Figure 219: Selecting Specific Entries for Transfer

The Transfer Entries option can be used to purge files. You can define a SCHOLAR ARCHIVE file containing a subset of the fields that are in the original file (perhaps the fields: NAME, SSN, and DATE OF BIRTH); you can then simply transfer into this separate file all or a selected group of entries from the original file, deleting the entries as they are transferred.

Transferring Entries into a New File

You can use the Transfer Entries option to create a new file. To do this:

1. At the "INPUT TO WHAT FILE:" prompt, enter the name of a nonexistent file.
2. If you have programmer access, you will be prompted for the global location for the new file.
3. When you specify the file to transfer *from*, you can request that the data dictionary of that file be copied as the data dictionary for your new file.

Here is an example of using the Transfer File Entries option to create a new file:

```
INPUT TO WHAT FILE: SCHOLAR COPY
Are you adding 'SCHOLAR COPY' as a new FILE? No// Y <RET> (Yes)
FILE NUMBER: 16031// <RET>

INTERNAL GLOBAL REFERENCE: ^DIZ(16031, // <RET>
...SORRY, I'M WORKING AS FAST AS I CAN...
A FreeText NAME Field (#.01) has been created.
TRANSFER FROM FILE: SCHOLAR
DO YOU WANT TO TRANSFER THE 'SCHOLAR' DATA DICTIONARY INTO YOUR NEW
FILE? YES
```

Figure 220: Using the Transfer File Entries Option to Create a New File

You are asked the global reference question only if you have programmer access.

Answering YES copies (or "clones") the data definitions of the old file. Then, if the old file has had any templates created, you will be asked:

DO YOU WANT TO COPY 'SCHOLAR' TEMPLATES INTO YOUR NEW FILE?

Once you have created a new file with identical field and template descriptions, you can transfer entries into it. This is a method of copying a file.

Transfer File Entries

Compare/Merge File Entries Option

The Compare/Merge File Entries option allows you to compare the data value of two entries before merging them into one entry. Furthermore, this option provides you with an opportunity to identify the data values from either entry that will be used to create the final merged entry. Both of the entries involved must be in the same file to use this option.

Comparing Entries

You can use the Compare/Merge File Entries option as a simple tool to compare entries. To do this:

1. Identify a file.
2. Identify the two entries to be compared.
3. Answer NO to the "MERGE ENTRIES AFTER COMPARING THEM?" prompt.

In this example below, two similar entries in the SCHOLAR file are used.

```
Select TRANSFER OPTION: COMPARE/MERGE FILE ENTRIES
COMPARE ENTRIES IN WHAT FILE: SCHOLAR
COMPARE SCHOLAR: RU
```

Figure 221: Selecting Entries to Compare in a File (1)

VA FileMan responds to this abbreviated response with the matching entries in the list that follows:

```
1  RUSSELL,BERTRAND A.
2  RUSSELL,BERTRAND W.
CHOOSE 1-2: 1
WITH SCHOLAR: RUSSELL,BERTRAND W.

NOTE: Use this option ONLY DURING NON-PEAK HOURS if merging entries in a
file that is pointed-to either by many files, or by large files.

MERGE ENTRIES AFTER COMPARING THEM? No// <RET>
```

Figure 222: Selecting Entries to Compare in a File (2)

Here you choose whether to simply compare entries or to actually merge them. If you are merging, the process of repointing entries in other files from the merged-from entry to the merged-to entry can be time-consuming or may create many tasked jobs. This is more likely if the file is pointed to by many files or if the files that point to it have many entries. In these situations, consider merging at times when your system is not busy.

```

DO YOU WANT TO DISPLAY ONLY THE DISCREPANT FIELDS? NO// <RET>
DEVICE: <RET>                RIGHT MARGIN:      80// <RET>

COMPARISON OF SCHOLAR FILE ENTRIES          FEB 14, 1991  11:59  PAGE 1
SCHOLAR          RUSSELL, BERTRAND A.      RUSSELL, BERTRAND W.
-----
*** NAME          RUSSELL, BERTRAND A.      RUSSELL, BERTRAND W.
*** SSN           999-99-9999              888-88-8888
*** SUBJECT AREA  PHILOSOPHY                MATHEMATICS
*** DATE OF BIRTH 1872
Press RETURN to continue or '^' to exit:
    
```

Figure 223: Comparison Output

The asterisks ("***") appearing in front of the field label indicate the entries contain different data in those fields. This simple report compares the data in each field in the two entries.

Merging Entries

You can use the Compare/Merge File Entries option to merge entries. To do this:

1. Identify a file.
2. Identify the two entries to be compared.
3. Answer YES to the "MERGE THESE ENTRIES AFTER COMPARING THEM?" prompt.
4. Choose which entry will supply the default values.
5. Choose to retain or delete the "merge from" record.
6. Optionally adjust, field-by-field, which entry supplies the default value.
7. Choose to proceed with the merge, summarize before merging, or re-edit the merge criteria.

The Merge process is described in detail via an example below:

```
MERGE THESE ENTRIES AFTER COMPARING THEM? NO// YES
  1 RUSSELL,BERTRAND A.
  2 RUSSELL,BERTRAND W.
```

Figure 224: Merging Entries in a File

After choosing a file and two entries to compare, enter YES at the "MERGE THESE ENTRIES AFTER COMPARING THEM? NO//" prompt to merge the entries as well as compare them.

You now specify which of the two entries will be used to supply the default values. The entry you choose will be the "merge to" entry that will contain the merged data.

```
NOTE: Records will be merged into the entry selected for the default.
WHICH ENTRY SHOULD BE USED FOR DEFAULT VALUES (1 OR 2)? 1
*** Records will be merged into RUSSELL,BERTRAND A.
```

Figure 225: Choosing Which File Entry will Serve as the Default Entry

You next indicate the disposition of the "merge from" entry. You can choose to delete it or retain it unmodified. You can also redirect pointers that point to the "merged from" entry to point to the "merge to" entry. Free text pointers will *not* be redirected.

```
DO YOU WANT TO DELETE THE MERGED FROM ENTRY AFTER MERGING ? YES
DO YOU WANT TO REPOINT ENTRIES POINTING TO THIS ENTRY? YES
ENTER FILE TO EXCLUDE FROM REPOINT/MERGE:<RET>
```

Figure 226: Deleting the "Merged From" File Entry

You can also choose to exclude pointers from specified files in the repointing process. In this example (Figure 226), all pointers will be repointed.

```
DO YOU WANT TO DISPLAY ONLY THE DISCREPANT FIELDS? NO// <RET>
DEVICE: <RET>
```

Figure 227: Setting Up the Merge Output

Press the Enter/Return key at the "DEVICE:" prompt so that you can continue to control how the merge is to proceed. Since the merge is interactive, it is not appropriate to release control to a printer or other output device. While working at a keyboard printer is possible, it is not recommended, because you will not be able to monitor the selection of data values that is described below.

VA FileMan will display the data from the entries being merged. Brackets indicate the values that will be used to create the final merged entry. If the data values in both entries are the same, no brackets are shown. To start, the values for Russell, Bertrand A. are bracketed because that entry was chosen as the default entry. To switch the value that will go into the merged entry, enter that field's number. The following example shows the initial defaults in brackets and the response to switching the value for the SSN field:

```
COMPARISON OF SCHOLAR FILE ENTRIES      FEB 14, 1991  11:59  PAGE 1
SCHOLAR          [RUSSELL, BERTRAND A.]  RUSSELL, BERTRAND W.
-----

1.  NAME          [RUSSELL, BERTRAND A.]  RUSSELL, BERTRAND W.
2.  SSN           [999-99-9999]          888-88-8888
3.  SUBJECT AREA  [PHILOSOPHY]          MATHEMATICS AND PHILOSOPHY
4.  DATE OF BIRTH [1872]

Default is enclosed in brackets, e.g., [RUSSELL, BERTRAND A.]
Enter 1-4 to change a default value, ^ to exit report, RETURN to continue: 2

COMPARISON OF SCHOLAR FILE ENTRIES      FEB 14, 1991  11:59  PAGE 1
SCHOLAR          [RUSSELL, BERTRAND A.]  RUSSELL, BERTRAND W.
-----

1.  NAME          [RUSSELL, BERTRAND A.]  RUSSELL, BERTRAND W.
2.  SSN           999-99-9999          [888-88-8888]
3.  SUBJECT AREA  [PHILOSOPHY]          MATHEMATICS AND PHILOSOPHY
4.  DATE OF BIRTH [1872]

Default is enclosed in brackets, e.g., [RUSSELL, BERTRAND A.]
Enter 1-4 to change a default value, ^ to exit report, RETURN to continue: <RET>
```

Figure 228: Merge Output (1)

The DATE OF BIRTH field (Figure 228) from Russell, Bertrand W. is bracketed because the default entry has no value for that field; it is null. When the default ("merged to") entry has no data in a field, data will always be brought over from the "merged from" entry. You have no control over this aspect of the merging. Even if you attempt to switch the data value to the null value and remove the brackets, the data will still be brought into the "merged to" field.

If there is more than one screen of field information, VA FileMan will display additional screens. In this case, there is one field that is a Multiple. The Compare/Merge File Entries option neither displays data from WORD-PROCESSING or Multiple fields nor allows the selection of data for the final "merge to" entry. The number of subentries in the Multiples of the two fields is displayed:

```

COMPARISON OF PATIENT FILE ENTRIES      FEB 14, 1991 11:59 PAGE 2
SCHOLAR          [RUSSELL, BERTRAND A.]  RUSSELL, BERTRAND W.
-----
NOTE: Multiples will be merged into the target record.

1. "TOPICS"          " 5 entries"          " 4 entries"

Enter RETURN to continue: <RET>

```

Figure 229: Merge Output (2)

The merging of data for a WORD-PROCESSING field or for a Multiple and its subfields is done in the same way that the Transfer File Entries option does it.

Although VA FileMan is ready to perform the merge at this time, you are prompted with other options—just in case you are not ready. In order to cancel the merge, enter the up-arrow ("[^]") at the "ACTION:" prompt to exit.

```

OK.  I'M READY TO DO THE MERGE.

      Select one of the following:
          P PROCEED to merge the data
          S SUMMARIZE the modifications before proceeding
          E EDIT the data again before proceeding

ACTION:

```

Figure 230: Merge Options

These three options are described below.

PROCEED

If you enter P or PROCEED at the "ACTION:" prompt, then VA FileMan will proceed to merge the data specified:

```
ACTION: PROCEED to merge the data.

I will now merge all subfiles in this file ...
This may take some time, please be patient.

I will now repoint all files that point to this entry ...
This may take some time, please be patient.

Gathering files and checking 'PT' nodes

Merging entries

Merge complete

Deleting From entry
```

Figure 231: Merge PROCEED Option

The merging of the data is now complete. Be careful when using this option because the "merge from" entry can be deleted and data could be lost.

SUMMARIZE

To review the changes that will be made to the "merge to" entry, enter an S or SUMMARIZE at the "ACTION:" prompt before proceeding to merge. The following will be shown:

```

ACTION:  SUMMARIZE the modifications before proceeding
SUMMARY OF MODIFICATIONS TO RUSSELL,BERTRAND A.
FIELD   OLD VALUE  NEW VALUE
-----
2.  SSN    999-99-9999  888-88-8888
4.  DATE OF BIRTH    1872

NOTE: Multiples will be merged into the target record
Enter RETURN to continue: <RET>

```

Figure 232: Merge SUMMARIZE Option

EDIT

Enter an E or EDIT at the "ACTION:" prompt to change the decisions made earlier. If you choose this action, you will again be shown the values in both entries, with your current selections in brackets, and will have the opportunity to switch the data going into the "merge to" entry.

Transfer File Entries

14. Extract Tool

Using the Extract Tool, you can move or copy data from logical records in VA FileMan files to a new VA FileMan file. This new file may either *permit* users to modify its contents or *prevent* users from modifying its contents and can be available for online inquiries and print processes. If this new file is used to store archived data, any options and utilities that create new entries or update existing entries are restricted. Options and utilities that update the data dictionary are also restricted.

Extract Overview

The following is an overview of the process of using the Extract Tool to extract entries from a file:

1. Identify the files and fields from which to extract data by using information in the data dictionary listings.
2. Build a destination file by creating a new field for each field in the source file.
3. Select the source file entries from which data will be extracted by creating a SEARCH/SORT template.
4. Select the fields from which data will be extracted by creating an EXTRACT template.
5. Move the extracted data to the destination file by using the Update Destination File option.
6. Purge the selected entries from the active database.

Extract Tool

Important Items to Note

Before beginning the extract process, consider each of the following important facts about the Extract Tool:

- An extract activity is file-specific, not user-specific. Anyone with access to the file and the Extract Tool options can complete or change an existing extract activity.
- When the extracted data is moved to the destination file, the source entries in the primary file are blocked from selection.
- A Subfile cannot be extracted by itself. At least one field from every Multiple level *above* the Subfile must also be extracted. If no field is extracted at the next higher level, the .01 field at that level will automatically be extracted.
- You may want to extract Identifiers and/or KEY fields from the source file to the destination file, so that records in the destination file can be uniquely identified.
- An EXTRACT template is the only type of PRINT template that can be used by the Update Destination File option.
- The ARCHIVAL ACTIVITY file (#1.11) contains a brief history that describes who performed the various extract activity steps and when the steps were completed.
- The extract activity can be canceled at any time before the Purge Extracted Entries option is used.
- The Purge Extracted Entries option deletes all of the source data in the primary file from which you extracted data.
- Selected entries cannot be purged until they have been moved to the destination file.
- A second extract from a file cannot be performed until the active extract activity has been completed, either by purging or canceling.

Source File

The term source file represents the primary file and any other files that can be referenced by extended pointers. The primary file is the starting file from which you will extract your data. The term extract field refers to any field in the source file.

Destination File

The term "destination file" represents the VA FileMan file that stores the extracted data. The destination file can be located anywhere on the network that is recognized by the system. To create this file, you select either of two VA FileMan options: Modify File Attributes or the Extract Tool's Modify Destination File.

For each extract field in the source file, a corresponding field in the destination file must exist. Certain DATA TYPES can optionally be resolved to external form before moving the data to the destination file. For example, data extracted from a POINTER TO A FILE DATA TYPE field can be moved to a FREE TEXT-type field in the destination file, if external form of data is moved; or such data can be moved to a NUMERIC-type field, if the internal value is moved (see the "Mapping Information" topic that follows).

The destination file uses a file level attribute called ARCHIVE FILE. The following is a description of this flag:

- YES means this is an archive file and users *cannot* modify or delete the data or the data dictionary. Any data dictionary changes may invalidate the archived data.
- NO (or null) means there are no restrictions on the file.

If you need to update an archive file's data dictionary, you must convert the old data to the new data dictionary format.

Updates to an archive file will be allowed only through the extract option, Update Destination File option, or through the programmer entry point EXTRACT^DIAXU.

For more information on the Extract Tool API (EXTRACT^DIAXU), please refer to the *VA FileMan Programmer Manual*.

Only Regular, KWIC, and Soundex-type cross-references are recommended for archive files. No other types of cross-references should be created.

If you are building a destination file that will store archived data, set the ARCHIVE FILE flag to YES (do this with the Modify Destination File option). Setting the ARCHIVE FILE flag to YES prevents users from modifying or deleting the data in the file or the file's data dictionary while using VA FileMan options or programmer calls. Users are also prevented from deleting file entries while using VA FileMan options or programmer calls.

Mapping Information

Mapping information identifies the relationship between the data in the source file and the data in the destination file. When you create your EXTRACT template, you will enter the name of the field in the source file and identify its intended location in the destination file. You will need to ensure that the DATA TYPE of the field in the destination file is compatible with the DATA TYPE of the extract field. The compatibility of the DATA TYPEs is validated when the fields are specified during template creation.

The following table recommends the DATA TYPE to use, depending on the DATA TYPE of the extract field:

DATA TYPE of Extract Field	DATA TYPE of Destination Field
DATE/TIME	1) DATE/TIME, internal form of data is moved. 2) FREE TEXT, external form of data is moved.
NUMERIC	NUMERIC or FREE TEXT.
SET OF CODES	1) FREE TEXT, if external form of the SET OF CODES is moved. 2) SET OF CODES, if internal form of the SET OF CODES is moved. User must make sure the SET OF CODES fields are identical in both the source file and the destination file data dictionaries.
FREE TEXT	FREE TEXT.
WORD-PROCESSING	WORD-PROCESSING.
COMPUTED	FREE TEXT, DATE/TIME, or NUMERIC.
POINTER TO A FILE	1) NUMERIC, if internal form of data is moved. 2) Non-pointer field type (FREE TEXT, NUMERIC, or DATE/TIME), if external form of data is moved.
VARIABLE-POINTER	1) Non-pointer field type, if external form of data is moved; (if the .01 fields of the pointed-to files have different DATA TYPES, DATA TYPE of destination field should be FREE TEXT). 2) FREE TEXT, if internal form of data is moved.

Table 28: DATA TYPE Recommendations

Table 28 (continued):

DATA TYPE of Extract Field	DATA TYPE of Destination Field
MUMPS	MUMPS.
Multiples	Multiples.
Backward Pointers	Multiples.

Table 28: DATA TYPE Recommendations (continued)

Here are additional guidelines that you must follow while creating your destination file:

- If you are extracting a **SET OF CODES**-type field and you are mapping it to a **FREE TEXT**-type field, use a maximum length of the same—or greater than—length as the longest external value in the SET OF CODES field. If you are mapping the SET OF CODES-type field to a SET OF CODES-type field, create the corresponding field in the destination file, using the same specifications as the extract field.
- If you are extracting **FREE TEXT, DATE/TIME, NUMERIC, WORD-PROCESSING, or MUMPS DATA TYPE** fields, create the corresponding field in the destination file, using the same specifications as the extract field.
- If you are extracting a **Multiple**-type field, create the corresponding field in the destination file as a Multiple-type field. Multiples in the source file are moved to Multiples in the destination file, following the DATA TYPE recommendations listed above. The structure of the Multiple in the destination file should be the same as that in the source file down to the lowest level Multiple that you extract. When extracting data in a Subfile, at least one field from every Multiple level above the Subfile must also be extracted. If you do not specify a field to extract at a higher level, the .01 field at that level will automatically be extracted.
- If you are extracting a **Backward Extended Pointer**-type field, create the corresponding field in the destination file as a Multiple. The Extract Tool resolves Backward Pointers. Thus, their values are moved to Multiples in the destination file.

Extract Tool

- If the field you are extracting has an **OUTPUT transform**, make sure the **INPUT transform** of the destination field can receive the data in the format generated by the OUTPUT transform.

ARCHIVAL ACTIVITY File

To learn about the status of an extract activity you can enter a question mark at most of the prompts in the Extract Tool options. Using the Inquire to File Entries option on the ARCHIVAL ACTIVITY file (#1.11) will yield information about past or pending activities. Those activities created by the Extract Tool are referred to as extract activities. The amount of information displayed depends on the status of the extract activity. The ARCHIVAL ACTIVITY file contains the following information:

- The DUZ of the individual performing the extract activity.
- The status of the extract activity (e.g., EDITED or UPDATED).
- The dates on which the activities were performed.
- The number of entries extracted.
- The source file number.
- The SEARCH/SORT and PRINT templates used in the extract activity.

For VA FileMan V. 20.0 and later, the ARCHIVAL ACTIVITY file contains data about both archiving and extract activities. A file can have only *one* active activity at a time—either an archiving activity or an extract activity. You can only select an extract activity from the Extract Tool options. When you use the Inquire to File Entries option, the word EXTRACT will appear for all extract activities.

Extract Tool

Extract Steps

The order of the options on the Extract Tool submenu reflects the sequence of steps in which you ordinarily perform your extract activity. To access to the Extract Tool options, start at the Other Options submenu. Here's a sample of the dialogue that you will encounter.

```
Select OPTION: OTHER OPTIONS
Select OTHER OPTION: EXTRACT DATA TO FILEMAN FILE
Select EXTRACT OPTION: ?
ANSWER WITH EXTRACT OPTION NUMBER, OR NAME CHOOSE FROM:
  1          SELECT ENTRIES TO EXTRACT
  2          ADD/DELETE SELECTED ENTRIES
  3          PRINT SELECTED ENTRIES
  4          MODIFY DESTINATION FILE
  5          CREATE EXTRACT TEMPLATE
  6          UPDATE DESTINATION FILE
  7          PURGE EXTRACTED ENTRIES
  8          CANCEL EXTRACT SELECTION
  9          VALIDATE EXTRACT TEMPLATE
```

Figure 233: Extract Tool Options

Select Entries to Extract Option (1 of 9)

The Select Entries to Extract option initiates the extract activity. In this option the entries are selected and stored in a template and an entry in the ARCHIVAL ACTIVITY file is created. Entries are selected in the same manner as the Search File Entries option.

For guidance on selecting entries, please refer to the "Search" chapter of the *VA FileMan Getting Started Manual*.

The Select Entries to Extract option performs the following functions:

1. During the search phase, the search criteria for selecting entries is specified and must be stored in a template.

If you want to extract a subentry contained in a Multiple field, you must extract the entire entry.

2. During the sort phase—which is indicated by the "SORT BY" prompt—you can enter additional restrictions on the entries to be selected. If no further

restrictions are required, simply accept the defaults provided at the "SORT BY" and "START WITH" prompts.

3. During the print phase—which is indicated by the "PRINT FIELD" prompt—VA FileMan gathers the entries specified in the search and sort phases and adds the internal entry numbers of the selected entries to the SEARCH template. Although specifying print fields is not required, the print process must be run to completion. Simply press the Enter/Return key at the "PRINT FIELD" prompt or specify actual fields to print a report of identifying information for the extracted records.

In the sample dialogue that follows, notice the sequence in which the search, sort, and print prompts appear:

```

EXTRACT FROM WHAT FILE: CHANGE

-A- SEARCH FOR CHANGE FIELD: .01 <RET> NO.
-A- CONDITION: LESS THAN
-A- LESS THAN: 900

-B- SEARCH FOR CHANGE FIELD: <RET>

IF: A// <RET> NO. LESS THAN 900

STORE RESULTS OF SEARCH IN TEMPLATE: ZZTEST TEMPLATE
Are you adding 'ZZTEST TEMPLATE' as a new SORT TEMPLATE? No// Y <RET> (Yes)

SORT BY: VERSION
START WITH VERSION: FIRST// <RET>
  WITHIN VERSION, SORT BY: <RET>
FIRST PRINT FIELD: .01 <RET> NO.
THEN PRINT FIELD: VERSION
THEN PRINT FIELD: PROGRAMMER
THEN PRINT FIELD: <RET>
HEADING: CHANGE EXTRACT SEARCH Replace <RET>
DEVICE: <RET>

```

Figure 234: Search, Sort, and Print Options When Selecting Entries to Extract

The resulting output looks like:

CHANGE NO.	EXTRACT VERSION	SEARCH PROGRAMMER

101	17.10	DOE, JANE
102	17.32	DOE, JOHN
103	17.35	DOE, JOHN
3 MATCHES FOUND.		

Figure 235: Select Entries to Extract Output

After you use this option, VA FileMan marks the ARCHIVAL ACTIVITY file entry with a status of SELECTED. If an unfinished extract activity exists for a file and you select this same file for a subsequent extract activity, you will see the following message:

There is already an outstanding *extract* activity.
Please finish it or CANCEL it.

Figure 236: An Example of a Notice from VA FileMan's Extract Tool Regarding an Outstanding Extract Activity

Since the ARCHIVAL ACTIVITY file maintains a record of both your extract and archiving activities, you will see the italicized word *archiving* whenever the outstanding file activity is an archiving one. To add or delete entries from the SEARCH/SORT template you just created, use the Add/Delete Selected Entries option.

Add/Delete Selected Entries Option (2 of 9)

When you wish to add entries to the extract activity or you wish to delete an entry or entries, use the Add/Delete Selected Entries option. This option provides an easy way to eliminate undesired entries or to add needed ones to your list of entries to extract. Like the Inquire to File Entries option, this option displays a selected entry and then asks if you wish to delete or add the entry. If you modify the list, then the activity's status in the ARCHIVAL ACTIVITY file changes from SELECTED to EDITED.

You can only use this option to modify your list before the entries are moved to the destination file. If you need to change the extract activity list after the destination

file is updated, you will need to cancel the extract activity and start a new extract activity.

To use the Add/Delete Selected Entries option, select the extract activity you wish to modify by entering the archival activity number, source file number, or source file name. Then select the entry to be added or deleted. The following dialogue depicts the sequence you will follow when adding an entry to the extract activity:

```
Select EXTRACT OPTION: ADD/DELETE SELECTED ENTRIES
Select EXTRACT ACTIVITY: ?
  ANSWER WITH ARCHIVAL ACTIVITY ARCHIVE NUMBER, OR FILE
CHOOSE FROM:
  3   CHANGE  08-30-92  SELECTED      SELECTOR:SMITH,J
      EXTRACT

Select EXTRACT ACTIVITY: 3 <RET>  08-30-92  SELECTED
  SELECTOR:SMITH,J  EXTRACT

Select CHANGE NO.: 330
NO.: 330                      VERSION: 17.09
PROGRAMMER: DOE,JULIA          ROUTINE:  DIL2
DATE CHANGED:  OCT 24, 1995

ADD this entry TO the EXTRACT SELECTION? YES// <RET>
```

Figure 237: Using the ADD/DELETE SELECTED ENTRIES Option

NOTE:

- Entering two question marks ("??") at the "Select EXTRACT ACTIVITY:" prompt displays a list of file entries.
- The phrase "*on EXTRACT list*" appears next to those entries that are currently part of the extract activity.
- The question "DELETE this entry...?" appears whenever you select an entry that is currently on the extract list.
- "ADD this entry...?" appears whenever you select an entry that is not among the items on the list.

Print Selected Entries Option (3 of 9)

To display the list of entries you have selected, use the Print Selected Entries option. This option uses the standard VA FileMan interface for printing.

For guidance on printing entries, please refer to the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

The example that follows depicts the type of dialogue you will encounter when printing a list of entries to be extracted:

```
Select EXTRACT OPTION: PRINT SELECTED ENTRIES
Select EXTRACT ACTIVITY: 3 <RET> CHANGE 08-30-92 EDITED
SELECTOR:SMITH,J EXTRACT

Enter a regular Print Template name or fields you wish to see
printed on this report of records to be extracted.

FIRST PRINT FIELD: [ZZTEST TEMPLATE
```

Figure 238: Using the PRINT SELECTED ENTRIES Option

The output looks like:

```
CHANGE EXTRACT ACTIVITY          AUG 30, 1992  11:09  PAGE 1
NO.                               VERSION        PROGRAMMER
-----
101                               17.10         DOE,JANE
102                               17.32         DOE,JOHN
103                               17.35         DOE,JOHN
330                               17.09         DOE,JULIA
```

Figure 239: PRINT SELECTED ENTRIES Option Output

Modify Destination File Option (4 of 9)

You can use either the Modify File Attributes option or the Modify Destination File option when you are ready to create the destination file that will receive your extracted data. You can also use these options to correct discrepancies that you noticed while you were building your EXTRACT template. The two options are nearly identical. However, one major difference exists: the Modify Destination File

option prompts for a new file attribute: ARCHIVE FILE (see the "Destination File" topic previously described in this chapter). If you use the Modify File Attributes option to create the destination file, you will need to access the Modify Definition File option to set the ARCHIVE FILE flag.

Here is a sample of the type of dialogue that you will encounter when modifying your destination file:

```
Select EXTRACT OPTION: MODIFY DESTINATION FILE

This option allows you to build a file which will store data
extracted from other files.  When creating fields in the
destination file, all data types are selectable.  However, only a
few data types are acceptable for receiving extracted data.

Please see your User Manual for more guidance on building the
destination file.

MODIFY WHAT FILE: CHANGE EXTRACT
```

Figure 240: Using the MODIFY DESTINATION FILE Option (1)

From this point on, you will see the usual dialogue while creating a new file and creating fields.

Once you have finished creating your destination file, you will see the dialogue that follows:

```
Select FIELD: <RET>
ARCHIVE FILE? NO// ?

    Enter either 'Y' or 'N'

ARCHIVE FILE? NO// ??
    'YES' will not allow modifications or deletions of data or data
dictionary
    'NO' will place no restrictions on the file.

ARCHIVE FILE? NO// <RET>

Select EXTRACT OPTION:
```

Figure 241: Using the MODIFY DESTINATION FILE Option (2)

Create Extract Template Option (5 of 9)

When selecting destination fields for data to be extracted into, keep in mind that the INPUT transforms of the destination fields are executed for each field value. For an extracted record, the value of each field in the record is tested against the INPUT transform of its destination field. If any field fails the INPUT transform, the extract for the entire record will fail. Make sure the INPUT transforms on the destination fields are appropriate for the data you will be extracting.

If you are extracting a **Subrecord** using the EXTRACT^DIAXU entry point and its FILING_LEVEL parameter, and a value fails the INPUT transform, only the extract of the Subrecord will fail.

When you are ready to build an EXTRACT template, you must select the Create Extract Template option. Using this option, you will identify not only the field you wish to extract from the source file but also its corresponding field in the destination file. The EXTRACT template is the only type of PRINT template used in the Update Destination File option.

Building an EXTRACT template requires entering valid field numbers or field names at the "EXTRACT FIELD" prompt. Since VA FileMan stores EXTRACT templates in the PRINT TEMPLATE file (#.4), this option uses the term "PRINT TEMPLATE" instead of "EXTRACT TEMPLATE" in the dialogue. For each extract field that you identify in the source file, at the "MAP TO" field prompt, enter the destination file field name or field number that will receive the data. Only those fields defined in the EXTRACT template will appear in the destination file.

Keep in mind that the value of each field in an extracted record is tested against the INPUT transform of its destination field. If any value fails its destination field's INPUT transform, the extract for the entire record will fail. Make sure the INPUT transforms on the destination fields are appropriate for the data you will be extracting.

If you are extracting a **Subrecord** using the EXTRACT^DIAXU entry point and its FILING_LEVEL parameter, and a value fails the INPUT transform, only the extract of the Subrecord will fail.

Extract Tool

When you arrive at the "STORE EXTRACT LOGIC IN TEMPLATE:" prompt, enter the name that you wish to assign to your new EXTRACT template. To edit an existing EXTRACT template, on the other hand, simply enter its name at the "FIRST EXTRACT FIELD:" prompt—using the following format:

```
"[Extract templatename]"
```

Here is a sample of the dialogue that you will encounter when you are ready to build an EXTRACT template:

```
Select EXTRACT OPTION: CREATE EXTRACT TEMPLATE

This option lets you build a template where you specify fields to extract and
their corresponding mapping in the destination file.

For more detailed description of requirements on the destination file, please
see your VA FileMan User Manual.

OUTPUT FROM WHAT FILE: CHANGE <RET> (956 entries)
DESTINATION FILE: CHANGE EXTRACT <RET> (0 entries)

FIRST EXTRACT CHANGE FIELD: .01 <RET> NO.
MAP NO. TO CHANGE EXTRACT FIELD: .01 <RET> NO.

THEN EXTRACT CHANGE FIELD: VERSION
MAP VERSION TO CHANGE EXTRACT FIELD: VERSION

THEN EXTRACT CHANGE FIELD: PROGRAMMER
MAP PROGRAMMER TO CHANGE EXTRACT FIELD: PROGRAMMER

STORE EXTRACT LOGIC IN TEMPLATE: CHANGE EXTRACT
Are you adding 'CHANGE EXTRACT' as a new PRINT TEMPLATE? No// YES <RET> (Yes)
```

Figure 242: Using the CREATE EXTRACT TEMPLATE Option

While you are creating your EXTRACT template, VA FileMan performs a few validation checks. Inspecting the extract field and its corresponding field in the destination file, VA FileMan checks to see if both fields are compatible in several important areas, including DATA TYPE, minimum length, maximum length, minimum values, maximum values.

If a discrepancy exists, VA FileMan will display an error message such as the following statement:

```
PROGRAMMER field in CHANGE EXTRACT file should have a maximum
length of at least 30 characters.
```

Figure 243: An Example of a Notice from VA FileMan's Extract Tool Regarding a Discrepancy

After VA FileMan displays an error message about your destination field, you can continue building your template. You will not, however, be able to update the destination file until you have corrected the problem.

Here is the warning that you will see when any source field and its corresponding destination field fail one of the validation checks:

```
THE DESTINATION FILE DATA DICTIONARY SHOULD BE MODIFIED PRIOR TO  
ANY MOVEMENT OF EXTRACT DATA!
```

Figure 244: An Example of the Warning from VA FileMan When the Validation Check Fails

At any "MAP 'FIELD NAME' TO 'FILE NAME' FIELD:" prompt, entering two question marks (" ??") yields a list of the selectable fields in the destination file. The list gets shorter as fields are selected to ensure that no two extract fields map information to a single field in the destination file.

Update Destination File Option (6 of 9)

Once you have used the Update Destination File option, the extracted data from the source file is moved to the destination file. After you enter the name of the EXTRACT template that you wish to use, VA FileMan makes sure the template's mapping information is correct and acceptable and then populates the destination file, adding entries as new records. VA FileMan will not, however, check to see if any of those records to be moved already exist in the destination file. Since this two-step process can be quite time-consuming, it can be queued at the "DEVICE:" prompt.

Extract Tool

Here is a sample of the dialogue:

```
Select EXTRACT OPTION: UPDATE DESTINATION FILE
Select EXTRACT ACTIVITY: 3 <RET>  CHANGE  08-31-92      EDITED
SELECTOR:SMITH,J  EXTRACT

You MUST enter an EXTRACT template name.  This EXTRACT template
will be used to populate your destination file.
PRINT TEMPLATE: CHANGE EXTRACT <RET>      **EXTRACT**      (AUG
30,1992)          USER #2  FILE #16000

Excuse me, this will take a few moments...
Checking the destination file...

If entries cannot be moved to the destination file, an exception
report will be printed.

Select a device where to print the exception report.

QUEUEING to this device will queue the Update process.
EXCEPTION REPORT DEVICE: QUEUE TO PRINT ON
DEVICE: PRINTER
```

Figure 245: Using the UPDATE DESTINATION FILE Option

After the destination file has been updated, VA FileMan changes the extract activity status from **SELECTED** or **EDITED** to **UPDATED DESTINATION FILE**. At this point, the entries from the source file are no longer available on lookups. This protective measure prevents you from attempting to edit the selected source file entries so that they contain the same data as the corresponding destination file entries.

The following Exception Report is printed when the Extract Tool fails to move all of the data in a source entry into the destination file. A failed INPUT transform is one possible cause of such a failure. In this case, the incomplete entry in the destination file is deleted. The source entry is not locked and its internal entry number is deleted from the extract list. The total number of entries extracted is reduced by the total numbers of entries appearing on the exception report.

```

EXTRACT  ACTIVITY EXCEPTION REPORT                JUN 27,1996  PAGE: 1
-----
EXTRACT ACTIVITY: 9                ARCHIVER: SMITH, J

THE FOLLOWING ENTRIES IN THE 'TEST' FILE WERE NOT MOVED BY THE
EXTRACT TOOL

Entry # 9 was NOT processed because:
  The value 'NEW' for field FTEXT MULT LABEL in FTEXT MULT SUB-FIELD in file TEST
is not
valid.

Enter # 30 was NOT processed because:
  The value 'NEW' for field FTEXT MULT LABEL in FTEXT MULT SUB-FIELD in file TEST
is not
valid.

*** PLEASE KEEP THIS FOR FUTURE REFERENCE ***

```

Figure 246: Extract Tool's Exception Report

The following is a list of recommended steps to take when an exception report is printed:

1. Finish the active extract activity by purging or canceling.
2. Determine the problem with the source entry and fix it.
3. If there are several entries on the exception report, start another extract activity. Your SEARCH/SORT template can be reused to use the same search specifications.
4. Adjust the extract list to match the list of entries on the exception report by using the Add/Delete Selected Entries option.
5. Proceed as before.

For exceptions caused by INPUT transforms, keep in mind that the value of each field in an extracted record is tested against the INPUT transform of its destination field. If any value fails its destination field's INPUT transform, the extract for the entire record will fail. Make sure the INPUT transforms on the destination fields are appropriate for the data you will be extracting.

If you are extracting a **Subrecord** using the `EXTRACT^DIAXU` entry point and its `FILING_LEVEL` parameter, and a value fails the `INPUT` transform, only the extract of the Subrecord will fail.

Purge Extracted Entries Option (7 of 9)

If you have `DELETE` access to the primary file, you can use the Purge Stored Entries option to delete extracted data from the primary file (our example is the `CHANGE` file). After you have purged your entries, VA FileMan will update the `ARCHIVAL ACTIVITY` file. If you attempt to purge an extract activity that lacks the status `UPDATED DESTINATION FILE`, you will encounter the following message:

```
Data has NOT YET been moved to the destination file!
```

When purging extracted data, you will encounter a dialogue much like the one that follows:

```
Select EXTRACT OPTION: PURGE EXTRACTED ENTRIES
Select EXTRACT ACTIVITY: 3 <RET> CHANGE 08-30-92 UPDATED
DESTINATION FILE SELECTOR:SMITH,J EXTRACT
```

Figure 247: Using the PURGE EXTRACTED ENTRIES Option (1)

If the source file has fields from other files pointing to it, the Extract Tool tells you:

```
The records about to be purged should not be 'pointed to' by other
records to maintain database integrity.

This option will DELETE DATA from both CHANGE
and from the ARCHIVAL ACTIVITY file.
Are you sure you want to continue? NO// YES

The entries will be deleted in INTERNAL NUMBER order.

<< 4 ENTRIES PURGED >>
```

Figure 248: Using the PURGE EXTRACTED ENTRIES Option (2)

As you can see (Figure 248), entering a YES response to the "Are you sure you want to continue? NO//" prompt deletes the entries **immediately!**

Cancel Extract Selection Option (8 of 9)

You can cancel an extract activity any time before the entries are purged by using the Cancel Extract Selection option. If the extract activity status is UPDATED DESTINATION FILE—meaning the entries have already been moved to the destination file—you'll see a warning notice. At this point, you can roll back or delete the new entries that were created while using the Update Destination File option.

After you have canceled an extract activity, VA FileMan deletes the ARCHIVAL ACTIVITY file reference to the extract activity. In addition, you will once again be able to gain access to all of those source entries that VA FileMan locked during the update of your destination file. If you wish to extract data without purging the source entries, cancel the extract activity to unlock the selected entries in the source file.

You will encounter the following dialogue while canceling an extract activity:

```
Select EXTRACT OPTION: CANCEL EXTRACT SELECTION
Select EXTRACT ACTIVITY: CHANGE <RET> 3 CHANGE 08-31-92
      UPDATED DESTINATION FILE      SELECTOR:SMITH,J EXTRACT

Are you sure you want to CANCEL this EXTRACT ACTIVITY? NO// ??
      Enter YES to stop this activity and start again from the beginning.

Are you sure you want to CANCEL this EXTRACT ACTIVITY? NO// YES

This extract activity has already updated the destination file.

Delete the destination file entries created by this extract activity? NO// ??

      Enter YES to rollback the destination file to its state before
the update.

Delete the destination file entries created by this extract
activity? NO// <RET>

>>> DONE <<<
```

Figure 249: Using the CANCEL EXTRACT SELECTION Option

If you wish to cancel an extract selection so that you can start over, enter YES at the "Delete the destination file entries..." prompt. Entering YES prevents you from sending a duplicate set of entries to the destination file. If, on the other hand, you

simply want to cancel the extract selection, pressing the Enter/Return key at the prompt unlocks the source entries and retains the destination file entries.

Validate Extract Template Option (9 of 9)

After you have corrected any discrepancies that VA FileMan might have pointed out while you were creating an EXTRACT template, you can use the Validate Extract Template option to quickly check your EXTRACT template's mapping information. The Validate Extract Template option will *not* alter anything in your template. Here is a sample dialogue:

```
Select EXTRACT OPTION: VALIDATE EXTRACT TEMPLATE
Select EXTRACT TEMPLATE: CHANGE EXTRACT          **EXTRACT**
                        (AUG 30, 1992)          USER #2  FILE #16000

Excuse me, this will take a few moments...
Checking the destination file...

Template looks OK!
```

Figure 250: Using the VALIDATE EXTRACT TEMPLATE Option

15. Filegrams

In order to use the full capabilities of VA FileMan's Filegram procedures, Kernel V. 6.5 or later must be installed on your system.

Filegrams are a feature in VA FileMan intended for use by System Managers, Package Developers, and Programmers.

A filegram is a process that moves a record (also called an entry) from a file on one computer system to a duplicate file on another *independent* computer system. An independent computer system is defined as a system having its own database. Sending data from the "live" account at a medical center to a "test" account at the same medical center is an example of moving a filegram locally. Sending data from a computer in the San Francisco Medical Center to a computer in the Salt Lake City Medical Center is an example of moving a filegram remotely.

The records you can move by a filegram can be either physical (stored in one file) or logical (related fields stored in different files). Logical records are loaded into filegrams by using VA FileMan's relational navigational syntax (:).

For successful filegram installation, the recipient system must have the following:

- Kernel V. 6.5 or later.
- The FILEGRAM HISTORY file (#1.12).
- The Filegram key to the Filegram submenu.
- A file structure that matches the one reflected by the entry in the filegram. This is the structure existing on the sender's system.

FILEGRAM-type Templates

The Filegram process requires you to create an OUTPUT template, which is stored in the PRINT TEMPLATE file (#.4) along with regular PRINT templates. VA FileMan recognizes the FILEGRAM-type and regular PRINT templates as OUTPUT templates, but their similarity ends there.

Since FILEGRAM-type templates are stored in the PRINT TEMPLATE file, the dialogues you encounter in the Filegram process will refer to a FILEGRAM-type template as a PRINT template.

Regular PRINT templates already created are screened so that you cannot accidentally replace an existing PRINT template with a FILEGRAM-type template.

Filegram and Archiving Relationship

FILEGRAM-type templates are the only kind of template allowed in the archiving process.

For a full description of archiving in VA FileMan, please refer to the "Archiving" chapter in this manual.

Using Filegrams

Here is a summary of the basic steps needed to send and install a filegram:

1. The filegram **sender** creates a FILEGRAM-type template for a specified file (Create/Edit Filegram Template option). The Display Filegram Template option can be used to review the template.
2. The **sender** can optionally designate specifiers with the Specifiers option. These are used for matching existing entries with filegrams.
3. The **sender** then generates a filegram for a specific entry (Generate Filegram option). The filegram is placed into a MailMan message. The filegram sender sends this message to an individual or individuals at a remote or local destination.
4. The **recipient** receives the Filegram with MailMan, reading the mail message containing the filegram, and forwarding it to S.DIFG-SRV-HISTORY. This is a special server that loads the message into the recipient's FILEGRAM HISTORY file (#1.12) and sets up the interface between VA FileMan and MailMan on the target system.
5. If you want to install the filegram on a system other than the one where you received it, instead of immediately forwarding to the S.DIFG-SRV-HISTORY server, forward the message to an individual on the ultimate target system (who in turn forwards it to *their* S.DIFG-SRV-HISTORY server).
6. Both the **sender** and the **recipient** can use the View Filegram option to inspect the filegram.
7. Then the **recipient** of the filegram on the target system uses the Install/Verify Filegram option to install the filegram into the destination file.
8. **Senders** and **recipients** can delete a filegram at any time.

The recipient can choose to modify the S.DIFG-SRV-HISTORY server or create another server to aid in the installation of filegrams.

For additional information about setting up servers, please refer to the Kernel and MailMan documentation.

Filegram Steps

Create/Edit Filegram Template Option

Use the Create/Edit Filegram Template option to create a FILEGRAM-type template or edit an existing FILEGRAM-type template. A FILEGRAM-type template is similar to a regular PRINT template without any formatting instructions. You always receive the "STORE FILEGRAM LOGIC IN TEMPLATE:" prompt, no matter how many fields you identify.

For information about regular PRINT templates, please refer to the "Print: How to Print Reports from Files" chapter of the *VA FileMan Getting Started Manual*.

The Create/Edit Filegram Template option is the first step in developing a filegram; there won't be a filegram without the template. This template is also used in the archiving process. Before using this option, you may wish to familiarize yourself with the file(s) and fields involved.

The following dialogue illustrates how to create a FILEGRAM-type template:

```
OUTPUT FROM WHAT FILE: CHANGE
FIRST SEND CHANGE FIELD: ??
```

Figure 251: Creating a FILEGRAM Template (1)

You can enter **ALL** at this prompt, if you want to include all fields in the file in your filegram. **ALL** can also be used in existing file navigation paths. Enter **[?]** at this prompt to get a listing of existing FILEGRAM-type templates for the selected file.

Filegrams

Here, two question marks ("??") requests a list of the fields in the file.

```
CHOOSE FROM:
  .01  NAME
  1    VERSION
  2    TAG
  3    ROUTINE
  4    CHANGE
  5    REPORTER (multiple)
  6    DATE CHANGED
  7    PROGRAMMER
  9    BUG OR FEATURE
  10   PURPOSE
  11   DESCRIPTION (word-processing)
```

Figure 252: Creating a FILEGRAM Template (2)

In the example that follows, the PROGRAMMER field is a pointer to the NEW PERSON file (#200).

```
FIRST SEND CHANGE FIELD: 1 <RET>  VERSION
THEN SEND CHANGE FIELD: 3 <RET>  ROUTINE
THEN SEND CHANGE FIELD: 4 <RET>  CHANGE
THEN SEND CHANGE FIELD: 5 <RET>  REPORTER (multiple)
  FIRST SEND REPORTER SUB-FIELD: .01
    THEN SEND REPORTER SUB-FIELD: <RET>
THEN SEND CHANGE FIELD: 6 <RET>  DATE CHANGED
THEN SEND CHANGE FIELD: 7 <RET>  PROGRAMMER
THEN SEND CHANGE FIELD: 11 <RET> DESCRIPTION (word-processing)
THEN SEND CHANGE FIELD: <RET>
STORE FILEGRAM LOGIC IN TEMPLATE: ZZTEST FILEGRAM
  Are you adding 'ZZTEST FILEGRAM' as a new PRINT TEMPLATE? No// Y <RET> (Yes)
```

Figure 253: Creating a FILEGRAM Template (3)

The template for your filegram is now set up. Edit this template just like you would any other PRINT template.

You do not have to include the .01 field, because it is automatically included for use as a lookup value.

To send logical records in a filegram, simply use file navigation to and from existing files at the "SEND FIELD:" prompts.

For a discussion of relational navigation using forward and backward pointers, please refer to the "Relational Navigation" chapter in this manual.

Display Filegram Template Option

The Display Filegram Template option displays the FILEGRAM-type template in a two-column format (like the Inquire to File Entries option). Multiple-type fields are shown last in the display, no matter what their field number.

Here is an example of the output produced by the Display Filegram Template option:

```
Select FILEGRAM OPTION: DISPLAY FILEGRAM TEMPLATE
SELECT FILEGRAM TEMPLATE: ZZTEST FILEGRAM

NAME: ZZTEST FILEGRAM          DATE CREATED: AUG 24, 1989
  READ ACCESS: @                FILE: 1001
  USER #: 29                    WRITE ACCESS: @
  DATE LAST USED: AUG 24, 1989

ORDER: 1                        FILEGRAM FILE: 1001
  LEVEL: 1                      DATE LAST STORED: AUG 24, 1989
FIELD ORDER: 1                  FIELD NUMBER: .01
CAPTION (c): NAME
FIELD ORDER: 2                  FIELD NUMBER: 1
CAPTION (c): VERSION
FIELD ORDER: 3                  FIELD NUMBER: 3
CAPTION (c): ROUTINE
FIELD ORDER: 4                  FIELD NUMBER: 4
CAPTION (c): CHANGE
FIELD ORDER: 5                  FIELD NUMBER: 6
CAPTION (c): DATE CHANGED
FIELD ORDER: 6                  FIELD NUMBER: 7
CAPTION (c): PROGRAMMER
FIELD ORDER: 7                  FIELD NUMBER: 11
CAPTION (c): DESCRIPTION
ORDER: 2                        FILEGRAM FILE: 1001.05
  LEVEL: 2                      PARENT: 1001
  CROSS-REFERENCE: MULTIPLE     USER RESPONSE TO GET HERE: REPORTER
  DATE LAST STORED: AUG 24, 1989
FIELD ORDER: 1                  FIELD NUMBER: .01
CAPTION (c): REPORTER

FIRST PRINT FIELD: S DIFGT=315 D FG^DIFGB;X//
COMPILED (c): N
```

Figure 254: FILEGRAM Template Output

The code in the FIRST PRINT FIELD has special meaning to VA FileMan.

Specifiers Option

The filegram sender uses the Specifiers option to identify a particular field in the file as a reference point to use when *installing* the filegram. The value of this field in the filegram is compared to values in the entries at the target site. The values *must* match for a filegram to be installed. If the specifier has a unique value for every entry in the file and is cross-referenced, that cross-reference is used to locate an entry. This reduces the search time and increases accuracy. Specifiers can be compared to identifiers: unlike identifiers, which are used for user interaction purposes, specifiers are used for transaction purposes. Specifiers are optional.

The dialogue that follows creates a specifier in a sample PATIENT file:

```
Select FILEGRAM OPTION: 5 <RET> SPECIFIERS
OUTPUT FROM WHAT FILE: PATIENT
Select FIELD: 3 <RET> SSN
Want to make SSN a specifier? NO// YES
Is the value of this field unique for each entry? NO// YES
```

Figure 255: An Example of Creating a Specifier (1)

Answer YES only if you have a regular cross-reference on the field that you are making a specifier. A field can be a specifier without being unique.

If you answer YES, a dialogue similar to the following occurs:

```
Select one of the following:
1 C REGULAR
If one of the above provides a direct look-up by SSN, please enter
its number or name: 1
```

Figure 256: An Example of Creating a Specifier (2)

To delete a specifier:

```
Select FIELD: 3 <RET> SSN
SSN is already a specifier.
Do you want to delete it? NO// YES
```

Figure 257: Deleting a Specifier

Generate Filegram Option

The Generate Filegram option is used by a filegram sender. Be sure that the DUZ correctly identifies the filegram sender; the DUZ is used to identify the filegram's sender to the recipient. The option creates a filegram in MailMan message format after you designate a file, FILEGRAM-type template, and a file entry. Concurrently, it creates a record in the FILEGRAM HISTORY File (the FILEGRAM HISTORY file [#1.12] points to the MESSAGE file [#3.9].) The record created in the FILEGRAM HISTORY file is called a filegram history. The filegram history allows VA FileMan to differentiate between a filegram message and a mail message. After the filegram is placed into the mail message, you can send it to an individual at any established address.

You can only send one entry at a time. The following dialogue illustrates the generation of a filegram:

```
Select FILEGRAM OPTION: GENERATE FILEGRAM
OUTPUT FROM WHAT FILE: CHANGE
Select FILEGRAM TEMPLATE: ZZTEST FILEGRAM
Select CHANGE NO.: 334
Send mail to: SYSTEM,MGR@METRODB.VA.GOV
And send to: <RET>
```

Figure 258: An Example of Generating a Filegram

Receiving Filegrams with MailMan

Filegram messages do not appear as NEW mail at the receiving site. After the mail message is received, the filegram recipient must read the mail message. Then, it should be forwarded to S.DIFG-SRV-HISTORY on the target system (i.e., the system on which the filegram will be installed). This is a special server used to load the message into the recipient's FILEGRAM HISTORY file (#1.12) and to set up the interface between VA FileMan and MailMan at the target system.

Here is an example of what the recipient would see when reading and forwarding a filegram:

```

Subj: FILEGRAM for entry #334 in CHANGE FILE (1001).  [#186309]
25 Aug 89 10:00 20 lines
From: SITE,MANAGER in 'IN' basket Page 1
-----
$DAT^CHANGE^1001^N^

Forward mail to: S.DIFG-SRV-HISTORY

SENDING A MESSAGE

```

Figure 259: An Example of a Filegram Received and Forwarded

View Filegram Option

Entries are made into the FILEGRAM HISTORY file (#1.12) at the sending site when the filegram is generated and at the receiving site by the S.DIFG-SRV-HISTORY server. The View Filegram option allows the filegram sender or recipient to inspect the filegram. Select this option and answer the "Select FILEGRAM

HISTORY:" prompt with a question mark to get a listing of available filegram histories. You can see the filegram history just created by using the **<Spacebar><Return>** or another filegram history by entering its internal entry number or date/time.

The following example shows you what a simple (without pointers) filegram looks like. The View Filegram option will show this information to a filegram's sender. The receiver sees additional information about the transmission of the mail message including the network mail path taken to the target system.

```

FILEGRAM for entry #334 in CHANGE FILE (#1001) .

```

Figure 260: An Example of a Simple Filegram (Without Pointers)

Install/Verify Filegram Option

The filegram recipient uses the Install/Verify Filegram option to install a filegram from a MailMan message into a file on the target system. Choose a filegram history by entering its date/time or by using a **<Spacebar><Return>** (for the last used history) at the "Select FILEGRAM HISTORY:" prompt. The destination file for the filegram entry must be in place on the target system for a successful installation!

The installation will more likely succeed if the destination file is a replica of the sending file.

The message "DONE" is displayed if the install was successful. If not successful, an UNSUCCESSFUL INSTALLATION message is returned with an error code.

The "^DIFG" topic in the "Filegrams API" chapter in the "Other APIs" section in the *VA FileMan APIs Manual* contains a list of error codes identifying their meaning.

Deleting a Filegram

Delete a filegram by removing the filegram's entry from the FILEGRAM HISTORY file (#1.12). As shown in the following dialogue, use the Enter or Edit File Entries option. Enter the at-sign ("@") at the DATE/TIME prompt of the filegram history you want to delete.

```
Select OPTION: ENTER OR EDIT FILE ENTRIES

INPUT TO WHAT FILE: FILEGRAM HISTORY
EDIT WHICH FIELD: ALL// <RET>

Select FILEGRAM HISTORY: 8-24-1994@11:10:00
DATE/TIME: AUG 24, 1994@11:10:00// @
SURE YOU WANT TO DELETE THE ENTIRE FILEGRAM HISTORY? YES
```

Figure 261: Deleting a Filegram

16. Archiving

To use VA FileMan's archiving procedure, Kernel V. 6.5 or later must be installed on your system. To use the Find Archived Records option to retrieve records archived with VA FileMan versions earlier than V. 20.0, Kernel V. 7.1 or later must be installed on your system.

In general computer terms, archiving is a procedure that permits you to remove data from an online database and place that data into a low-cost storage medium, such as magnetic tape, for long-term retention.

Archiving in VA FileMan is a complete purge that simply clears data from your system. In other words, no data restoration is provided! However, there is a data retrieval option.

This facility is a prototype and supported only as a developer's tool. You must access your archiving options directly through VA FileMan from programmer mode (e.g., >D Q^DI).

VA FileMan performs the archiving function by searching through file entries using specified criteria, extracting and transporting the selected entries by filegrams to temporary storage in the ARCHIVAL ACTIVITY file (#1.11), and then simply writing the data to permanent storage. The FILEGRAM-type template used to transport an archive activity can be created during the archiving session (in the Archiving menu options), or an existing FILEGRAM-type template created using the Filegram options can be used.

Archiving

Considerations Before Archiving

The following summarizes some of the important items to note regarding the archiving facility. Consider them before you begin archiving:

- We strongly encourage you to have a current backup of your files before archiving.
- Archiving is not user-specific. In other words, archiving is attached to a file not a user. For your own protection, please be aware that someone other than yourself can complete or change an existing archiving activity.
- Data from logical and physical files can be archived, but only the data from the physical (primary) file can be purged (removed).
- VA FileMan must be able to collect and print the data (using the search criteria) before you can create an archiving activity. That is, the Select Entries to Archive option must be run to completion such that the selected entries are printed (and can thus be stored in the ^DIBT SORT TEMPLATE global).
- If you plan to keep a hard copy of the printed entries for future reference, design your PRINT template to facilitate review. You do not need to print all of the fields' values that will be archived, but you may want to include those that, in combination, will uniquely identify the entry. Save the PRINT template for future use when archiving.
- When the archived entries are written to temporary storage, the corresponding original entry disappears from the user's view. (A new node, subscripted with -9, is added to the original entry so that it will be bypassed by the usual VA FileMan calls.)
- If data to be archived is contained in a Multiple field, then the entire entry must be archived. You cannot archive a subentry by itself.
- A FILEGRAM-type template is the only template type allowed in the Write Entries to Temporary Storage option.
- You cannot have more than one archiving activity on a file at a time.
- Data selected for archiving can be permanently saved to any **sequential** storage media, for example: SDP, a VMS file, magnetic tape, or a removable disk pack.
- Depending on the number of entries involved, be prepared for the search (the Select Entries to Archive option) and write (the Write Entries to Temporary Storage option) processes to be time-consuming.
- A brief history of who performed the various archive steps and when they were accomplished is saved in the ARCHIVAL ACTIVITY file.

Archiving

- You can cancel your archiving process, by using the Cancel Archival Selection option, at any time before the Purge Stored Entries option is used.
- The Find Archived Entries option can be used to verify that the archive medium contains all the information intended to be archived.
- The Purge Stored Entries option completely deletes data from the file being archived and from the ARCHIVAL ACTIVITY file.
- You cannot purge archived entries until you have moved selected entries to permanent storage. Thus, you need not worry about losing entries before they're archived.
- You cannot start a second archive from a file until you purge or cancel the existing archiving activity on that file.

Archiving Process, including Archiving Options (1-9)

The order of the options on the Archiving submenu reflects the sequence of steps in which you ordinarily do archiving. Access the Archiving submenu from the Other Options submenu:

```

Select OPTION: OTHER OPTIONS
Select OTHER OPTION: ARCHIVING

Select ARCHIVE OPTION: ?
ANSWER WITH ARCHIVE OPTION NUMBER, OR NAME
CHOOSE FROM:
  1          SELECT ENTRIES TO ARCHIVE
  2          ADD/DELETE SELECTED ENTRIES
  3          PRINT SELECTED ENTRIES
  4          CREATE FILEGRAM ARCHIVING TEMPLATE
  5          WRITE ENTRIES TO TEMPORARY STORAGE
  6          MOVE ARCHIVED DATA TO PERMANENT STORAGE
  7          PURGE STORED ENTRIES
  8          CANCEL ARCHIVAL SELECTION
  9          FIND ARCHIVED ENTRIES

```

Figure 262: Archiving Options

Select Entries to Archive

The Select Entries to Archive option creates the archiving activity. It is used similarly to the Search File Entries option. The Select Entries to Archive option is the first step in developing an archiving activity and is very important since there cannot be any archiving without the SEARCH template created in this option.

Here's a tip—It's important to know which entries you want archived and where you want them stored before you start the archiving process!

This mandatory archiving option really performs three important functions:

1. A search for file entries that meet your specified search criteria or condition (truth test) occurs first. The results of this search are then stored in a template you specify. You must store these results in a template!

For guidance on how to use the search option procedures, please refer to the "Search" chapter in the *VA FileMan Getting Started Manual*.

2. After storing the results of the search in a template, a sort of the file by any field must occur. This sort is as important as the search portion of this option! Do not use any sort criteria that contains M code. Be careful, if you limit the sort range, you will limit the entries selected for archiving. You can delete unwanted entries later by using the Add/Delete Selected Entries option.
3. Finally, a print of the fields to be archived to a printer or the screen (CRT) must occur. Printing fields that uniquely identify the entries being archived gives you a permanent record of the archived entries.

You *cannot* create an archiving activity until *at least one* entry is located according to your search criteria, sorted, and printed to a printer or a terminal!

If a subentry to be archived is contained in a Multiple field, the entire entry must be archived.

An example of the dialogue you may encounter follows. Notice the sequence of search, sort, and print:

```

ARCHIVE FROM WHAT FILE: CHANGE

-A- SEARCH FOR CHANGE FIELD: .01 <RET> NO.
-A- CONDITION: LESS THAN
-A- LESS THAN: 900

-B- SEARCH FOR CHANGE FIELD: <RET>

IF: A// <RET> NO. LESS THAN 900

STORE RESULTS OF SEARCH IN TEMPLATE: ZZTEST TEMPLATE
Are you adding 'ZZTEST TEMPLATE' as a new SORT TEMPLATE? No// Y <RET> (Yes)

SORT BY: VERSION

103            17.35                DOE,JOHN
                                     3 MATCHES FOUND.

```

Figure 263: An Example of Selecting Entries to Archive

After using this option, the status of your archiving activity is **SELECTED**. The status of an archiving activity can be **SELECTED**, **EDITED**, **ARCHIVED (TEMPORARY)**, **ARCHIVED (PERMANENT)**, or **PURGED**. You may identify a file at the "ARCHIVE FROM WHAT FILE:" prompt and get the response that follows:

```

There is already an outstanding archiving activity.
Please finish it or CANCEL it.

```

Figure 264: An Example of a Notice from VA FileMan Regarding an Outstanding Archiving Activity

This message means that the file you identified has already been selected for archiving and that archiving activity has not been completed; a second one cannot be started yet. Since the ARCHIVAL ACTIVITY file is being shared by both archiving and extract activities, the italicized word in the message will say *extract* if the outstanding activity on the file identified is an extract.

Add/Delete Selected Entries

Use the Add/Delete Selected Entries option to add entries to or delete them from the archiving activity. This is an easy way to clear out unwanted entries or add needed ones before archiving.

This option uses the Inquire to File Entries option to display the selected entries and then allows you to add or delete an entry. If you add or delete an entry to an established archiving activity, then the status of the activity will change to EDITED.

The Add/Delete Selected Entries option will *not* allow you to edit an archiving activity list after the Write Entries to Temporary Storage option has been done. If you need to change the archiving activity list after writing to temporary storage, you must cancel that archiving activity and start a new one.

When using this option, you first select the archiving activity number that you want to modify. You can also identify the archiving activity by its file number or file name. Then, choose the entry that you want to add or delete.

Here is an example in which an entry is being added to the archiving activity:

```

Select ARCHIVE OPTION: ADD/DELETE SELECTED ENTRIES
Select ARCHIVAL ACTIVITY: ?
  ANSWER WITH ARCHIVAL ACTIVITY ARCHIVE NUMBER, OR FILE
CHOOSE FROM:
  1      VA FILEMAN CHANGE           08-05-89      ARCHIVED (PERMANENT)
SELECTOR:LOUIE,LOUIE      ARCHIVING
  3      CHANGE                       08-30-92      SELECTED
SELECTOR:SMITH,J        ARCHIVING

Select ARCHIVAL ACTIVITY: 3

Select CHANGE NO.: 330
NO.: 330                      VERSION: 17.09
PROGRAMMER: DOE,JULIA        ROUTINE: DIL2
DATE CHANGED: OCT 24, 1986

ADD this entry TO the ARCHIVAL SELECTION? YES// <RET>

```

Figure 265: An Example of Adding an Entry to the Archival Activity

If you enter two question marks ("??") at the prompt where you select the entry for addition or deletion, a list of the file's entries is displayed. Those that are already part of the archiving activity are identified by "*ON ARCHIVE LIST*". The "ADD this entry TO the ARCHIVAL SELECTION? YES//" question appears if you have selected an entry *not* already on the list for archiving. A "DELETE ..." question appears if you have selected an entry already on the list.

Print Selected Entries

The Print Selected Entries option displays each entry from a selected archiving activity in a regular print or a filegram format (depending on the template you identify). The archiving activity entries are printed on whatever device you indicate. You can use this option for an archiving activity with any status except PURGED.

The example below illustrates the regular print format:

```

Select ARCHIVE OPTION: PRINT SELECTED ENTRIES
Select ARCHIVAL ACTIVITY: 3 <RET>          CHANGE  08-30-92      EDITED
SELECTOR:SMITH,J          ARCHIVING

Enter regular Print Template name or fields you wish to see printed
on this report of entries to be archived.

FIRST PRINT FIELD: [ZZTEST TEMPLATE

VERSION^1=17.09
$END DAT

```

Figure 267: Printing an Archival Activity in a Filegram Format

Create Filegram Archiving Template

The Create Filegram Archiving Template option creates a FILEGRAM-type template, which is the template used in the Write Entries to Temporary Storage option. A filegram is the tool used for extracting and transporting archived data to temporary storage.

For further explanation, see the "Write Entries to Temporary Storage" topic that follows.

You can create a new FILEGRAM-type template with this option or edit an existing one created using the Filegram or Archiving options.

Only those fields defined in the FILEGRAM-type template, the .01 field, and any PRIMARY KEY or Identifier fields will be archived to permanent storage.

The PRIMARY KEY is available as of Version 22.0.

You create a FILEGRAM-type template just as you create a PRINT template, except only valid field numbers or names can be entered. You cannot include print

qualifiers. You always get the "STORE FILEGRAM LOGIC IN TEMPLATE:" prompt, no matter how many fields you identify.

FILEGRAM-type templates are stored in the PRINT TEMPLATE file (#.4), so the FILEGRAM-type template is referred to as a PRINT template in the dialogue. However, VA FileMan can distinguish between PRINT and FILEGRAM-type templates.

If you want to edit an existing FILEGRAM-type template, identify it at the "FIRST SEND FIELD:" prompt by entering "[**Filegram templatename**". Otherwise, specify the fields you want included in the archive. (The .01 field and the file's PRIMARY KEY and Identifier fields will always be sent.) In the example that follows, all fields are being sent.

The PRIMARY KEY is available as of Version 22.0.

Here is an example of creating a FILEGRAM-type template:

```
Select ARCHIVE OPTION: CREATE FILEGRAM ARCHIVING TEMPLATE

OUTPUT FROM WHAT FILE: CHANGE

FIRST SEND CHANGE FIELD: ALL
Do you mean ALL the fields in the file? No// Y <RET> (Yes)
THEN SEND CHANGE FIELD: <RET>

STORE ARCHIVE LOGIC IN TEMPLATE: CHANGE FILEGRAM
Are you adding 'CHANGE FILEGRAM' as a new PRINT TEMPLATE? No// YES <RET>
(Yes)
```

Figure 268: An Example of Creating a Filegram Archiving Template

Write Entries to Temporary Storage

The Write Entries to Temporary Storage option writes your selected archiving activities to the ARCHIVAL ACTIVITY file into a WORD-PROCESSING field. This step is in preparation for moving the data to permanent storage. You *cannot* archive to permanent storage unless you use the Write Entries to Temporary Storage option first. Needless to say, this file could grow quite large and will shrink only after the Purge Stored Entries option has been run.

After using this option, the archived entries will appear to be missing from the primary file. This protective measure assures selected entries *cannot* be edited so

that entries in the file will match the archived version. The entries are *not* really gone, merely locked.

Also, after using this option, you *cannot* add or delete entries to an archiving activity. If changes in the selection of entries for archiving is necessary, you have to cancel this activity and restart.

 **This process can be quite time-consuming! It can be queued at the "DEVICE:" prompt. After it is completed, the status of your archiving activity is ARCHIVED (TEMPORARY).**

In the dialogue below, the entries in Archiving Activity #3 are being sent to temporary storage using the ZZTESTFILEGRAM FILEGRAM-type template. The task is being queued with output sent to PRINTER. The resulting report contains a header, dots, and archiving totals, as shown below:

```
Select ARCHIVE OPTION: WRITE ENTRIES TO TEMPORARY STORAGE
Select ARCHIVAL ACTIVITY: 3 <RET>          CHANGE 08-30-92      EDITED
SELECTOR:SMITH,J      ARCHIVING

You MUST enter a FILEGRAM template name.  This FILEGRAM template
will be used to actually build the archive message.

PRINT TEMPLATE: ZZTESTFILEGRAM <RET>  **FILEGRAM**  (AUG 30, 1992)  USER
#60 FILE #16000

DEVICE: QUEUE TO PRINT ON
DEVICE: PRINTER

CHANGE ARCHIVING ACTIVITY          AUG 30, 1992 15:01  PAGE 1
-----
.....
4 ITEMS HAVE BEEN ARCHIVED
```

Figure 269: An Example of Writing Entries to Temporary Storage

Move Archived Data to Permanent Storage

Once you have written an archiving activity to temporary storage, you can use the Move Archived Data to Permanent Storage option. If you choose an archiving activity that has not yet been written to temporary storage, a warning is issued.

This option will do several things not necessarily in the order listed here.

1. It will print an Archive Activity report, which prints information from the ARCHIVAL ACTIVITY file (#1.11), such as the archiver (i.e., the person who selected this option), the archival activity number, an index of all archived entries, and the search criteria used during the Select Entries to Archive process, etc.
2. It will build an index of all archived entries and write this index at the beginning of the archived file. An item in the index contains the .01 value of the entry, along with all PRIMARY KEY and Identifier values for that entry.

The PRIMARY KEY is available as of Version 22.0.

3. It will prompt for Archive Device Label information. This information will usually represent some naming convention that Systems Managers use as physical label for devices such as tape. If using a disk file, the full disk file name will be presented as a default. This device label information along with the index printed on the Archive Activity report should be useful in locating an archived entry and the device to which it was archived.
4. Lastly, this option will move archive data to permanent storage. Permanent storage is considered any sequential storage media like SDP, VMS file, magnetic tape, or disk data set.

You can send to more than one permanent storage location without having to recreate the archiving activity. When the archived data is moved to permanent storage, every line contained in the temporary storage word processing field is simply read and then written to a sequential medium.

The status of your archiving activity after using this option is ARCHIVED (PERMANENT).

In the example below, the archiving activity is identified by file name, "CHANGE." It is going to be archived to the specified tape:

```
Select ARCHIVE OPTION: MOVE ARCHIVED DATA TO PERMANENT STORAGE
Select ARCHIVAL ACTIVITY: CHANGE <RET>          3  CHANGE  08-30-92
ARCHIVED (TEMPORARY)      SELECTOR:SMITH,J      ARCHIVING

NOTE:  This option will 1) print an archive activity report to
specified PRINTER DEVICE and 2) will move archive data to permanent
storage to specified ARCHIVE STORAGE DEVICE.

Select some type of SEQUENTIAL storage media, such as SDP, TAPE, or
DISK FILE (HFS) for archival storage.

PRINTER DEVICE: PRINTER

ARCHIVE STORAGE DEVICE: MAGTAPE Parameter ("CAVL":0:2048)
DO YOU WANT YOUR OUTPUT QUEUED?  NO// YES
Requested Start Time:  NOW// <RET>

ARCHIVE DEVICE LABEL:  ISC6V3$MUA0:ARCHIVE;083092;3// <RET>
```

Figure 270: An Example of Moving Archived Data to Permanent Storage

If the archive storage device is tape, an archive device label is generated for you, as depicted in the previous example. You can override this label by entering your own device label information.

If you select an archive storage device that is non-sequential, a warning is issued. You are then given the option to continue the archiving process.

 **If you specify a device that can be overwritten (e.g., SDP) or that does *not* electronically store data (e.g., a printer), the data will be *forever* irretrievable.**

Depending on what devices are selected, and whether queueing was requested for either device, different warnings will be issued informing the user of either steps he need to take or steps that the program will take as a result of the queueing request.

Here is an example of an archive activity report:

```

ARCHIVE ACTIVITY REPORT                                AUG 30,1992  PAGE: 1
-----
ARCHIVAL ACTIVITY: 3
ARCHIVE DEVICE LABEL INFORMATION:  ISC6V3$MUA0:ARCHIVE;083092;3
PRIMARY ARCHIVED FILE:  CHANGE (#16000)
ARCHIVER:  SMITH,J
SEARCH CRITERIA:
      .01 LESS THAN 900

INDEX INFORMATION:

NO.          VERSION          PROGRAMMER
101          17.10            DOE,JANE
102          17.32            DOE,JOHN
103          17.35            DOE,JOHN
330          17.09            DOE,JULIA

*** PLEASE KEEP THIS FOR FUTURE REFERENCE ***

```

Figure 271: An Example of an Archive Activity Report

Purge Stored Entries

Before running the Purge Stored Entries option, use the Find Archived Entries option to verify that the archive medium contains the complete archived data for an archiving activity by searching for the last record listed on the index.

This option is used to remove archived data from both the archived file (our example is the CHANGE file) and the ARCHIVAL ACTIVITY file. A brief history of who performed the various archiving steps and when is saved in the ARCHIVAL ACTIVITY file.

If you select an archiving activity for purging that has not been sent to the archives, then you will receive the message:

```
Data has NOT YET been archived to PERMANENT storage!
```

Figure 272: An Example of a Notice from VA FileMan When Purging Without Archiving Data

Archiving

You will see the following dialogue when purging permanently archived data:

```
Select ARCHIVE OPTION: PURGE STORED ENTRIES

BEFORE YOU PURGE, MAKE SURE THAT YOUR ARCHIVE MEDIUM IS READABLE!
YOU MAY USE THE FIND ARCHIVED ENTRIES OPTION TO FIND THE LAST
ARCHIVED RECORD APPEARING ON THE INDEX.

Do you want to proceed?? NO// YES
Select ARCHIVAL ACTIVITY:  3 <RET>          CHANGE  08-30-92          ARCHIVED (PERMANENT)
SELECTOR:SMITH,J          ARCHIVING

This option will DELETE DATA from both CHANGE
and from the ARCHIVAL ACTIVITY file.

Are you sure you want to continue? NO// YES
```

Figure 273: An Example of Purging Permanently Archived Data

By answering **YES** to the "Are you sure you want to continue? NO//" prompt, the entries will be *immediately* deleted! Be sure this is your decision.

```
The entries will be deleted in INTERNAL NUMBER order.

<< 4 ENTRIES PURGED >>
```

Figure 274: VA FileMan Notifies You of the Number of Entries Purged

Cancel Archival Selection

The Cancel Archival Selection option is used to cancel an archiving activity before the Purge Stored Entries option occurs. You are warned if the archiving activity has already been moved to permanent storage.

When you cancel an archiving activity, the entry in the ARCHIVAL ACTIVITY file is deleted. Also, entries that were locked after being moved to temporary storage can again be read and edited.

See the following dialogue for canceling an archival activity:

```

Select ARCHIVE OPTION: CANCEL ARCHIVAL SELECTION
Select ARCHIVAL ACTIVITY: CHANGE <RET>          3 CHANGE  08-30-92      EDITED
SELECTOR:SMITH,J      ARCHIVING

Are you sure you want to CANCEL this ARCHIVING ACTIVITY? NO// YES

>>> DONE <<<

```

Figure 275: Canceling an Archival Activity

Find Archived Entries

The Find Archived Entries option scans an archive file and retrieves an archive entry (or entries) that matches the NAME field (#.01) and/or the PRIMARY KEY and/or Identifier field(s) of the requested entry. On the prompts for lookup values and on the resulting report, PRIMARY KEY and Identifier fields are both called "Identifiers." The information contained in the archived entry is printed in CAPTIONED format [field name (field number) = value]. This option should only be used with tapes or files archived under VA FileMan V. 19.0 or later.

The PRIMARY KEY is available as of Version 22.0.

Several requests for archived entries can be made at a time. An "(id)" next to a prompt indicates an Identifier, PRIMARY KEY, or Specifier field. One set of all the prompts makes one request.

The matching process is dependent on the presence or absence of an index on the archive file or tape. The matching process for archive files or tapes with no index can be more time-consuming, since it has to read the entire archived file to

Archiving

determine all matches. The matching process finds a match when the values of all the answered prompts match with that of an archived entry. If a partial value is typed at any prompt, the matching process finds all matches that begin with the partial value for that particular prompt.

See the following dialogue for finding archived entries:

```
Select ARCHIVE OPTION: FIND ARCHIVED ENTRIES

This option will scan your archived file and will attempt to
retrieve entries that match the name (.01) field and/or the
identifier field(s) of the archived file.

Magnetic tapes should be opened with variable length records.

SEQUENTIAL ARCHIVE DEVICE: HFS DISK FILE
HOST FILE NAME: TMP.TMP// ARC.DAT

You are reading archived information from the CHANGE file.
Do you want to continue? YES// <RET>

Multiple requests may be made.
One set of all prompts makes one request.

This archived file contains an index of all archived entries.

Figure 276: An Example of Finding Archived Entries (continued)

ARCHIVAL ACTIVITY File

The status of an archiving activity is displayed in the listing of activities when a question mark is entered at most of the Archiving options. You can also use the Inquire to File Entries option on the ARCHIVAL ACTIVITY file (#1.11) to obtain information about past or pending archiving activities. The amount of information you receive depends on the status of the archiving activity.

In summary, the information contained in this file describes who archived, status of the archive, when entries were archived, the number of items archived, name of the file archived, archiving activity internal entry number, and the SEARCH and PRINT templates used in archiving. If an archiving activity is purged, the ARCHIVAL ACTIVITY file contains the purge and archive date and the person who did the purge.

Beginning with VA FileMan V. 20.0, the ARCHIVAL ACTIVITY file contains data about both archiving and extract activities. A file can have only *one* active activity at a time—either an archiving activity or an extract activity. Archiving activities are selectable only within the Archiving options. When you are doing an inquire on the ARCHIVAL ACTIVITY file, the word ARCHIVING will appear for all archiving activities.

Archiving

Glossary

You can also search the Free Online Dictionary of Computing.

.001 Field	A field containing the internal entry number of the record.
.01 Field	The one field that must be present for every file and file entry. It is also called the NAME field. At a file's creation the .01 field is given the label NAME. This label can be changed.
Access Codes	In VA FileMan, a string of codes that determines your security access to files, fields, and templates. In Kernel, you enter an Access Code to identify yourself during signon.
Alternate Editor	One of the text editors available for use from VA FileMan. Editors available vary from site to site. They are entries in the ALTERNATE EDITOR file (#1.2).
At-sign ("@")	A VA FileMan security Access Code that gives the user programmer-level access to files and to VA FileMan's developer features. See Programmer Access. Also, the character "@" (i.e., at-sign) is used at VA FileMan field prompts to delete data.
Audit Trail	The record or log of an ongoing audit.
Auditing	The monitoring and recording of computer use.
Backward Pointer	A pointer to your current file from another file; used in the extended pointer syntax.
Boolean Expression	A logical comparison between values yielding a true or false result. In M, zero means false and non-zero (often one) means true.
Canonic Number	A number with no leading zeros and no trailing zeros after a decimal point.
Caption	In ScreenMan, a label displayed on the screen. Captions often identify fields that are to be edited.

Command Area	In ScreenMan, the bottom portion of the screen used to display help information and to accept user commands.
Cross-reference	An attribute of a field or a file that identifies an action that should take place when the value of a field is changed. Often, the action is the placement of the field's value into an index. A Traditional cross-reference is defined with a specific field. A New-Style cross-reference is a file attribute and can be composed of one or more fields. New-Style cross-references are stored in the INDEX file (#.11).
Cursor	On your display terminal, the line or rectangle identifying where your next input will be placed on the screen.
Data Dictionary	A record of a file's structure, its elements (fields and their attributes), and relationships to other files. Often abbreviated as DD.
DATA TYPE	The kind of data stored in a field. NUMERIC, COMPUTED, and WORD-PROCESSING are examples of VA FileMan DATA TYPEs.
Database	An organized collection of data spanning many files. Often, all the files on a system constitute that system's database.
Decentralized Hospital Computer Program (DHCP)	See VISTA.
Default	A computer-provided response to a question or prompt. The default might be a value pre-existing in a file. Often, you can change a default.
Device Prompt	A Kernel prompt at which you identify where to send your output.
Edit Window	In ScreenMan, the area in which you enter or edit data. It is highlighted with either reverse video or an underline. In Screen Editor, the area in which you enter and edit text; the area between the status bar and the ruler.

Entry	A record in a file. "Entry" and "record" are used interchangeably.
Extended Pointers	A means to reference fields in files other than your current file.
Field	In an entry, a specified area used to hold values. The specifications of each VA FileMan field are documented in the file's data dictionary.
Field Number	The unique number used to identify a field in a file. A field can be referenced by "#" followed by the field number.
File	A set of related records (or entries) treated as a unit.
Form	In ScreenMan, a group of one or more pages that comprise a complete transaction. Comparable to an INPUT template.
FREE TEXT	A DATA TYPE that can contain any printable characters.
Full-screen Editing	The ability to enter data in various locations on the two-dimensional computer display. Compare to scrolling mode.
Histogram	A type of bar graph that indicates frequency of occurrence of particular values.
Identifier	In VA FileMan, a field that is defined to aid in identifying an entry in conjunction with the NAME field.
Index	An ordered list used to speed retrieval of entries from a file based on a value in some field or fields. The term "simple index" refers to an index that stores the data for a single field; the term "compound index" refers to an index that stores the data for more than one field. Indexes are created and maintained via cross-references.
INPUT Template	A pre-defined list of fields that together comprise an editing session.
Internal Entry Number	The number used to identify an entry within a file. Every record has a unique internal entry number. Often abbreviated as IEN.

Kernel	A VISTA software package that functions as an intermediary between the host operating system and VISTA application packages. Kernel includes installation, menu, security, and device services.
Key	A group of fields that, taken collectively, uniquely identifies a record in a file or subfile. All fields in a key must have values. The term "simple key" refers to keys that are composed of only one field; the term "compound key" refers to keys that are composed of more than one field. Keys are stored in the KEY file (#.31)
LAYGO	A user's authorization to create a new entry when editing a computer file. An acronym for Learn As You Go .
Line Editor	The VA FileMan editor that lets you input and change text on a line-by-line basis. The Line Editor works in scrolling mode. See Screen Editor.
Lookup	To find an entry in a file using a value for one of its fields.
MailMan	An electronic mail system (e-mail) that allows you to send messages to and receive them from other users via the computer. It is part of VISTA.
Menu	A list that includes the names of options from which you can select an activity.
Multiple	A VA FileMan DATA TYPE that allows more than one value for a single entry. See Subfile.
MUMPS	Abbreviated as M. The American National Standards Institute (ANSI) computer language used by VA FileMan and throughout VISTA. The acronym MUMPS stands for Massachusetts General Hospital Utility Multi Programming System .
NAME Field	The one field that must be present for every file and file entry. It is also called the .01 field. At a file's creation the .01 field is given the label NAME. This label can be changed.

Navigation	<ol style="list-style-type: none">1. Navigation can mean switching your reference point from one file to another.2. Navigation can also mean moving your cursor around a terminal display or a document using cursor keys and other commands.
Non-canonic Number	A number with either leading zeros, or trailing zeros after a decimal point. M treats non-canonic numbers as text instead of as numbers.
Non-null	A value other than null. A space and zero are non-null values.
Null	Empty. A field or variable that has no value associated with it is null.
Null Response	When replying to a prompt, pressing only the Enter/Return key, abbreviated as <RET>, to enter nothing.
Numeric Expression	An expression whose value is a number. Compare to string expression.
Operator	One of the processes done to the elements in an expression to create a value.
Option	A computing activity that you can select, usually a choice from a menu.
Paste	Insert text or other data as input into one computer program that has been copied into a clipboard by the same or by another computer program.
Pattern Match	In M, an operator that compares the contents of a variable or literal to a specified pattern of characters or kinds of characters.
PF keys	Keys on a terminal keyboard labeled PF1 , PF2 , etc. that are used to perform special functions instead of displaying visible characters.
POINTER TO A FILE	A field DATA TYPE that contains an explicit reference to an entry in a file. POINTER TO A FILE-type fields are used to relate files to each other.

Pop-up Page	In ScreenMan, a page that overlays the regular ScreenMan screen in order to present the contents of a selected Multiple.
Preferred Editor	The editor always entered when you access a WORD-PROCESSING-type field; your default editor. Kernel must be present to establish a Preferred Editor.
PRINT Template	The stored specifications of a printed report, including fields to be printed and formatting instructions.
Programmer Access	The ability to use VA FileMan features that are reserved for application developers. Referred to as "having the at-sign ('@')" because the at-sign is the DUZ(0) value that grants programmer access.
Prompt	A question or message from the computer requiring your response.
Record	A set of data pertaining to a single entity in a file; an entry in a file.
Record Number	See Internal Entry Number.
Relational Navigation	Changing your current (or primary) file reference to another file. Relational navigation is accomplished by using the extended pointer syntax without specifying a field in the referenced file.
Required Field	A field that cannot be left null for an entry.
Scattergram	A graph in which occurrences of two fields are displayed on an X-Y coordinate grid to aid in data analysis.
Screen Editor	VA FileMan's Screen-oriented text editor. It can be used to enter data into any WORD-PROCESSING field using full-screen editing instead of line-by-line editing. See Line Editor.
Screen-oriented	A computer interface in which you see many lines of data at a time and in which you can move your cursor around the display screen using screen navigation commands. Compare to Scrolling Mode.

ScreenMan	The set of routines that supports Screen-oriented data editing and data display.
Scrolling Mode	The presentation of the interactive dialogue one line at a time. Compare to Screen-oriented.
SDP	An area on disk set aside for temporary, sequential storage of data; an abbreviation for Sequential Disk Processor . It is available on some M implementations (e.g., DSM-11).
SEARCH Template	The saved results of a search operation. Usually, the actual entries found are stored in addition to the criteria used to select those entries.
Security	The strategies and procedures used to ensure that user access to data and data structures is controlled and appropriate.
SET OF CODES	A field DATA TYPE where a short character string is defined to represent a longer value.
Simple Extended Pointers	An extended pointer that uses a pre-existing pointer relationship to access entries in another file.
Sort	To place items in order, often in alphabetical or numeric sequence.
SORT Template	The stored record of sort specifications. It contains sorting order as well as restrictions on the selection of entries. Used to prepare entries for printing.
Stuff	To place values directly into a field, usually with no user interaction.
Subentry	An entry in a Multiple; also called a Subrecord.
Subfield	A field in a Multiple.
Subfile	The data structure of a Multiple. In many respects, a Subfile has the same characteristics as a File.

Terminal Emulation	Using one kind of terminal or computer display to mimic another kind. Often used with PC remote communication applications.
Terminal Type	The designation of the kind of computer peripheral being used (e.g., the kind of video display or printer). Full terminal type functionality is supplied by Kernel.
Truth Test	An evaluation of an expression yielding a true or false result. In M, usually a 1 (true) or a 0 (false) is returned from a truth test.
Up-arrow	The ^ character (caret); used in VA FileMan for exiting an option or canceling a response. Also used in combination with a field name or prompt to jump to the specified field or prompt.
Upload	Send a file from one computer system to another (usually using communications software).
VISTA	The Veterans Health Information Systems and Technology Architecture (VISTA), within the Department of Veterans Affairs, is the component of the Veterans Health Administration that develops software and installs, maintains, and updates compatible computer systems in VA medical facilities. (Previously known as the Decentralized Hospital Computer Program [DHCP].)
